Building a Genomics Resource

A (personal) journey through time...

- Genomic Copy Number Variations in cancer (CNA / CNV)
- Comparative Genomic Hybridization (CGH) as the original CNV screening technique
- CNVs differ between cancer (sub)types and may correlate to clinical outcome
- single studies are limited in understanding disease-specific changes - let's build a database
- databases should be accessible - let's move online
- more data - data parsers & text mining
- visualization - graphics libraries and data formatting
- large datasets - access through APIs

progenetix.net: storage and visualization of genomic aberration data in human malignancies

michael baudis, md

Over the last decade, techniques for the genome wide scanning for genomic imbalances in malignant neoplasia have been developed, e.g. Comparative Genomic Hybridization (CGH).

Currently, no comprehensive online source for CGH data with a standardized format suitable for data mining procedures has been made available for public access. Such a data repository could be valuable in identifying genetic aberration patterns with linkage to specific disease entities, and provide additional information for validating data from large scale expression array experiments.

A case and band specific aberration matrix was selected as most suitable format for the mining of CGH data. The [progenetix.net] data repository was developed to provide the according data to the research community for a growing number of human malignancies.

In the current implementation, two main purposes are being served. First, access to the band specific pattern of chromosomal imbalances allows the instantaneous identification of genomic “hotspots”. Second, the band specific aberration matrices can be included in data mining efforts. As an example, the clustering off all informative cases from the current (September 2001) dataset is shown here (online source under www.progenetix.net/bcats/clustered.png).

Data selection

PubMed is searched for publications applying CGH to the analysis of malignant tumors. Articles are selected according to their online availability and the description of genomic imbalances on a per case basis.

Transformation of input data

Chromosomal aberration data is transformed via customized parsing commands to a common format adherent to ISCN 1995 recommendations. In some cases, aberration data was transcribed from graphical representations or provided by the authors.

Data storage

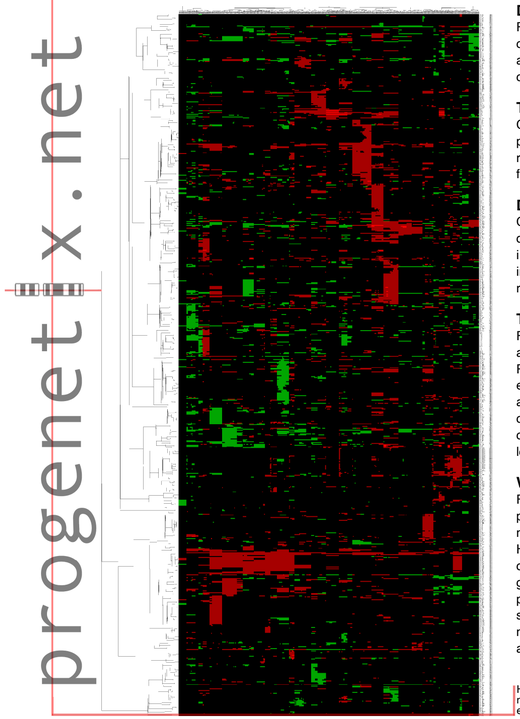
Currently, the primary data is stored in a dedicated “off-line” database. Besides case identifier and ISCN adapted chromosomal imbalance data, tumor classification and source information including the PubMed identifier is recorded. Disease entities are reclassified to ICD-O-3 codes.

Text parsing and generation of aberration matrix

For the generation of the case and band specific aberration matrix, a dedicated text pattern comparison model was developed using Perl. Briefly, for each chromosomal band, the aberration field of each case is searched for a variety of patterns containing aberration information applying to that band. A matrix with currently 324 band resolution is generated, annotating chromosomal gains with “1” and losses with “–1”; localized high-level gains are designated “2”.

Website generation

For graphical representation of chromosomal imbalances, HTML pages containing different views of the underlying aberration matrices are generated using Perl. Graphics are implemented using HTML syntax. Besides band specific, whole genomic overviews, chromosome specific pages with links to all involved cases are generated for each ICD-O-3 entity as well as for each registered project. Additionally, those representations are available for several subsets combining related data (e.g. all lymphoid neoplasias, breast carcinoma cases). For each of the groups, the according aberration matrix is linked for download.



Hierarchical clustering of band specific chromosomal imbalances from 999 human neoplasias, contained in the [progenetix.net] collection. Cases without aberrations were excluded.

Received on July 5, 2001; revised on July 9, 2001; accepted on July 16, 2001

ABSTRACT

Summary: Through sequencing projects and, more recently, array-based expression analysis experiments, a wealth of genetic data has become accessible via online resources. In contrast, few of the (molecular-) cytogenetic aberration data collected in the last decades are available in a format suitable for data mining procedures. www.progenetix.net is a new online repository for previously published chromosomal aberration data, allowing the addition of band-specific information about chromosomal imbalances to oncologic data analysis efforts.

Availability: http://www.progenetix.net

Contact: mbaudis@stanford.edu

Neoplastic transformation and progression is the result of genetic defects arising in normal cells and giving rise to a malignant clone. During the process of oncogenesis, some of the usually multiple steps required for acquisition of the full neoplastic phenotype may represent themselves as numerical or structural abnormalities in the chromosomes of the transformed cells.

Over the last decades, the analysis of chromosomal abnormalities in malignant cells has gained importance in oncologic research as well as in clinical practice. A vast number of genetic abnormalities has been identified in the virtually complete range of human neoplasias. Several attempts have been undertaken for collection and classification of those abnormalities, the most widely recognized being the catalog by Mitelman and co-workers (Mitelman, 1994; online access through http://cgap.nci.nih.gov/Chromosomes/Mitelman).

In addition to metaphase analysis of short-term cultivated tumor cells or tumor cell lines, molecular cytogenetic techniques have recently been applied to the analysis of chromosomal abnormalities in primary tumor tissues. One of the more widely used screening techniques is Comparative Genomic Hybridization (CGH; Kallioniemi *et al.*, 1992; du Manoir *et al.*, 1993). Briefly, this method is based on the competitive *in-situ* hybridization of differentially labeled tumor versus normal genomic DNA to normal human metaphase spreads. The calculation of the intensity ratios of the two fluorochromes gives an overview about relative gains and losses of DNA in the tumor genome with mapping to the respective chromosomal bands. The identification of frequently imbalanced regions in tumor entities may point towards tumor suppressor gene or proto-oncogenes mapping to the respective chromosomal bands. Usually, the result of those experiments is communicated either in text format according to the International System for Cytogenetic Nomenclature (Mitelman, 1995) or graphically, with aberration bars next to chromosomal ideograms for the representation of chromosomal gains and losses.

Because in each experiment CGH analysis covers the whole number of chromosomes, the comparision of data sets from related malignancies could lead to the delineation of common as well as divergent genetic pathways defining the respective malignant phenotypes. Although an extremely large number of malignant tumors has been analyzed using this technique, no comprehensive CGH database with band-specific chromosomal aberration information is publicly available[†].

A minimal requirement for such a database would be the conversion of the text or graphical information used in publications to data tables, representing the information about the aberration status of single chromosomal bands for each case. For the site discussed here, this process includes: (1) the transformation of the published results in a format adapted from the ISCN, and (2) the automatic generation of the band specific aberration table.

Due to format variations of the published data, step 1 consists of the manual conversion of the text data or evaluation and conversion of the graphical representations, respectively. Due to the (in computational terms) odd

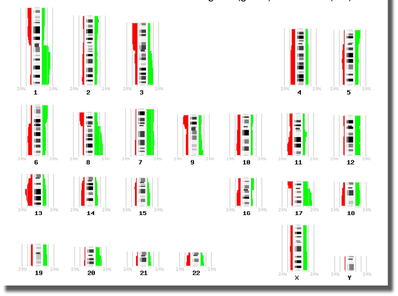
Collection and Transformation of Chromosomal Imbalances in Human Neoplasias for Data Mining Procedures

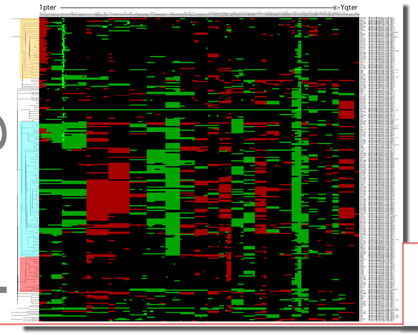
michael baudis, dept. of pathology, stanford university

Although the deciphering of the human genome has been pushed forward over the last years, little effort has been made to collect and integrate the treasure trove of clinical tumor cases analyzed by molecular-cytogenetic methods into current data schemes. Publicly announced at BCATS 2001, since then [progenetix.net] has been established as the largest public source of chromosomal imbalance data with band-specific resolution. Targets for the use of the data collection may be the description of prediction of oncogene and suppressor gene loci, identification of related loci for pathway creation, and especially the combination of the data with expression array experiments for filtering of relevant genes among the deregulated candidates.

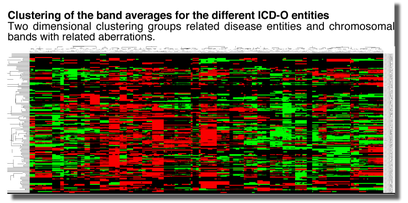
Chromosomal imbalances in 5478 clinical cases from 196 publications
Although not as prominent as in specific subgroups, this large collection shows the non-random distribution of chromosmal gains (green) and losses (red).



Material and Methods Chromosomal aberration data of more than 5478 cases from 196 publications describing results of Comparative Genomic Hybridization (CGH) experiments were collected. Minimal requirements were diagnosis of a malignant or benign neoplasia, analysis of clinical tumor samples and report of the analysis results on a case by case basis, resolved to the level of single chromosomal bands.Data was transformed from the diverse annotation formats to standardized ISCN “rev ish” nomenclature. For the transformation of the non-linear ISCN data to a two-dimensional matrix with code for the aberration status of each chromosomal band per case, a reverse pattern matching algorithm was developed in Perl. Graphical representations and cluster images are generated for all different subsets (Publications, ICD-O-3 entities, meta-groups) and presented on the progenetix.net website.

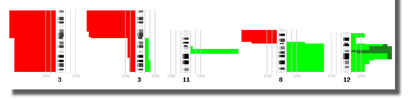


Clustering of the band averages for the different ICD-O entities
Two dimensional clustering groups related disease entities and chromosomal bands with related aberrations.



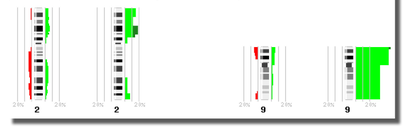
Results Out of 4896 tumor samples, 3862 (79%) showed chromosomal imbalances by CGH. The average per band probability was 4.5% for a loss (max. 12.9% at 13q21) and 6.5% for a gain (max. 15.6% at 8q23). Differences between neoplastic entities showed in the average frequency and distribution pattern of imbalanced chromosomal regions. Tumor subsets (10 or more cases) with the strongest hot spots for losses were small cell lung carcinomas (ave. 23.3% with max. 96.2% at 3p14p26) and pheochromocytomas (ave. 10.9% with max. 92.7% at 3p); prominent gain maxima were found in pure high grade infiltrating duct carcinomas of the breast (ave. 5.9% with max. 95.7% at 11q13), T-PLL (ave. 4.7% with max. 81.8% for whole 8q) and dedifferentiated liposarcomas (ave. 10.4% with max. 81.8% at 12q13), among others.
By cluster analysis, different combinations of chromosomal hot spot regions could be shown to occur in tumors subsummized in the same diagnostic entity; the example of neuroblastomas is shown.

Examples of hotspots of genomic imbalance
SCLC, pheochromocytoma, high grade DCIS, T-PLL, dedifferentiated liposarcoma



Conclusion So far, progenetix.net project was able to:
1. collect a large dataset of genomic aberration data generated through a molecular-cytogenetic screening technique (CGH)
2. develop the software tools to transform those data to a meta format compatible to commonly used genomic interval descriptions
3. produce graphical and numerical output from those data for hot spot detection and statistical analysis.
For future approaches, the data collection will be valuable for filtering data from expression array experiments for relevant genes, and possibly for the description of common and divergent genetic pathways in the oncogenetic process of different tumor entities.The transformed raw data of the progenetix.net collection is avaible for research purposes over the website.

Distinction of histologically related through their chromosomal aberration pattern
Amplification of the REL locus on 2p16 and gain of 9p(ter) distinguishes primary mediastinal B-cell lymphomas (PMBL, right) from diffuse large cell lymphomas (DLCL, left). The distinction may have clinical implications



Identification of different aberration patterns in Neuroblastoma (289 cases)
N-Myc (2p25) amplification is the hallmark of a subgroup, showing only consistant loss of the terminal portion 1p. Other groups are defined by the loss of parts of 11q, or a “chromosomal instability” phenotype. Gains on 17q are a common feature of all groups.
Those patterns may be combined with gene-level information to reconstruct the different pathways leading to malignant transformation.

Progenetix Database in 2003
Text conversion for CNVs

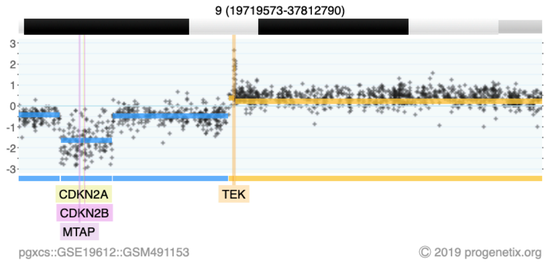
visualizing cancer genome array data @ arraymap.org

arrayMap is a curated reference database and bioinformatics resource targeting copy number profiling data in human cancer. The arrayMap database provides an entry point for meta-analysis and systems level data integration of high-resolution oncogenomic CNA data.

The current data reflects:

- 72724 genomic array profiles
- 898 experimental series
- 257 array platforms
- ICD-O 341 ICD-O cancer entities
- 795 publications (Pubmed entries)



Genomic copy number imbalances on chromosome 9 in a case of Glioblastoma (**GSM491153**), indcating, among others, a homozygous deletion involving CDKN2A/B.

For the majority of the samples, probe level visualization as well as customized data representation facilitate gene level and genome wide data review. Results from multi-case selections can be connected to downstream data analysis and visualization tools, as we provide through our Progenetix project.

arrayMap is developed by the group "Theoretical Cytogenetics and Oncogenomics" at the Institute of Molecular Life Sciences of the University of Zurich.

Disease annotations in Progenetix

From some text, somewhere, to ontology classes

- **diagnostic categories** are the **most important** labels to associate with genomic observations
- original data almost *never* uses **modern**, **hierarchical** classification systems but provides circumstantial ("breast cancer in pre-menopausal...") or domain-specific ("CLL Binet B", "colorectal carcinoma Dukes C") information
- clinical classifications (ICD-10 ...) have very limited relation to tumor biology
- concepts change over time ...
- for cancer, the "International Classification of Diseases in Oncology" (**ICD-O 3**) by IARC / WHO traditionally has been a good compromise to map to - but with non-hierarchical structure and is used by international reference projects

- since its beginning Progenetix samples have been classified using the 2 arms of the ICD-O system (morphology ~ histology/biology + topography ~ organ/tissue)
- over the last years we have established mappings between ICD-O code pairs and the NCIt "neoplasm" part of the NCI metathesaurus, thereby empowering hierarchical data structures for search and analysis

DX Ontologies

Hierarchical NCIt Neoplasm Core replaces heterogeneous primary annotations

- heterogeneous and inconsistent diagnostic annotations are common in clinical reports and research studies ("text", ICD-10, ICD-O 3, OncoTree, domain-specific classifications)
- highly **variable granularity** of annotations is a major road block for comparative analyses and large scale data integration
  - "Colorectal Cancer" or "Rectal Mucinous Adenoca."
- initiatives and services such as Phenopackets, MONDO, OXO ... rely on and/or provide mappings to hierarchical ontologies

progenetix

Standardized Data

Data re-use depends on standardized, machine-readable metadata

- Multiple international initiatives (ELIXIR, GA4GH, MONARCH...) and resource providers (EBI, NCBI ...) work on the generation and implementation of data annotation standards
- emerging / established principles are the use of hierarchical coding systems where individual codes are represented as CURIEs
- other formats for non-categorical annotations based on international standards, e.g.
  - ISO (ISO 8601 time & period, ISO 3166 country codes ...)
  - IETF (GeoJSON ...)
  - W3C (CURIE ...)
- these standards become pervasive throughout GA4GH's ecosystem (e.g. Phenopackets ...)

Data Curation

Provide "clean and correct data" - but final verification of data from external resources lies with the user ...

- correct data is important for any type of scientific analysis
- errors in formats and values can occur during all steps between data acquisition and analysis (numerous "Excelgates"!)
- "meta"-resources and analyses are prone to erroneous data due to varying input formats and lack of source control

➡ always look for batch effects and outliers!

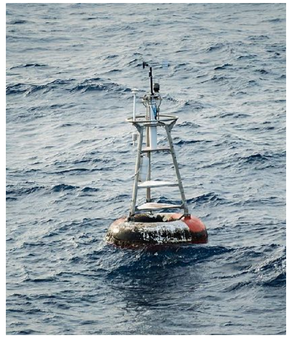
Data Curation - Geolocations

Provide "clean and correct data" - but final verification of data from external resources lies with the user ...

The most geo-tagged place on earth is Null Island



*A troubleshooting country has been added with an Indeterminate sovereignty class called **Null Island (1, 2)**. It is a fictional, 1 meter square island located off Africa where the equator and prime meridian cross. Being centered at 0,0 (zero latitude, zero longitude) it is useful for flagging geocode failures which are routed to 0,0 by most mapping services. Aside: "Null Islands" exist for all local coordinate reference systems besides WGS84 like State Plane (and global if not using modern Greenwich prime meridian). Null Island in Natural Earth is scaleRank 100, indicating it should never be shown in mapping. Side note: Rank 30 (zoom 29 in Google speak)*

Progenetix in 2022

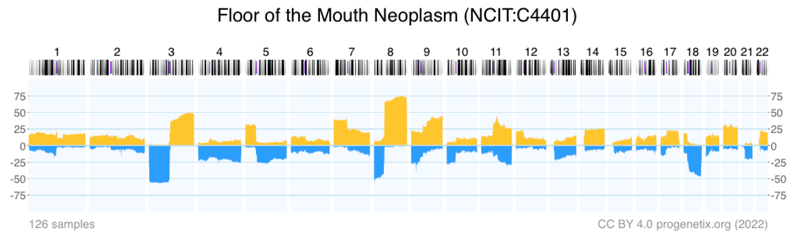
Cancer Genomics Reference Resource

- largest open resource for curated cancer genome profiles
- focus on copy number variations (CNV)
- >116'000 cancer CNV profiles, from >800 NCIt codes
- majority of data from genomic arrays with ~50% overall from SNP platforms with original data re-processing
- structured diagnostic encodings for NCIt, ICD-O 3, UBERON
- identifier mapping for PMID, GEO, Cellosaurus, TCGA, cBioPortal where appropriate
- core biosample and technical metadata annotations where accessible (TNM, genotypic sex, survival ...)
- publication database and code mapping services

progenetix

Cancer genome data @ progenetix.org

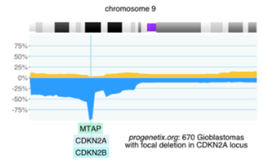
The Progenetix database provides an overview of mutation data in cancer, with a focus on copy number abnormalities (CNV / CNA), for all types of human malignancies. The data is based on *individual sample data* from currently **142063** samples.



Download SVG | Go to NCIT:C4401 | Download CNV Frequencies

Example for aggregated CNV data in 126 samples in Floor of the Mouth Neoplasm.
Here the frequency of regional **copy number gains** and **losses** are displayed for all 22 autosomes.

Progenetix Use Cases



Local CNV Frequencies

A typical use case on Progenetix is the search for local copy number aberrations - e.g. involving a gene - and the exploration of cancer types with these CNVs. The [Search Page] provides example use cases for designing queries. Results contain basic statistics as well as visualization and download options.

Cancer CNV Profiles

The progenetix resource contains data of **834** different cancer types (NCIt neoplasm classification), mapped to a variety of biological and technical categories. Frequency profiles of regional genomic gains and losses for all categories (diagnostic entity, publication, cohort ...) can be accessed through the [Cancer Types] page with direct visualization and options for sample retrieval and plotting options.

Cancer Genomics Publications

Through the [Publications] page Progenetix provides **4164** annotated references to research articles from cancer genome screening experiments (WGS, WES, aCGH, cCGH). The numbers of analyzed samples and possible availability in the Progenetix sample collection are indicated.

Abstract

In cancer, copy number aberrations (CNAs) represent a type of nearly ubiquitous and frequently extensive structural genome variations. To disentangle the molecular mechanisms underlying tumorigenesis as well as identify and characterize molecular subtypes, the comparative and meta-analysis of large genomic variant collections can be of immense importance. Over the last decades, cancer genomic profiling projects have resulted in a large amount of somatic genome variation profiles, however segregated in a multitude of individual studies and datasets. The Progenetix project, initiated in 2001, curates individual cancer CNA profiles and associated metadata from published oncogenomic studies and data repositories with the aim to empower integrative analyses spanning all different cancer biologies. During the last few years, the fields of genomics and cancer research have seen significant advancement in terms of molecular genetics technology, disease concepts, data standard harmonization as well as data availability, in an increasingly structured and systematic manner. For the Progenetix resource, continuous data integration, curation and maintenance have resulted in the most comprehensive representation of cancer genome CNA profiling data with 138 663 (including 115 357 tumor) copy number variation (CNV) profiles. In this article, we report a 4.5-fold increase in sample number since 2013, improvements in data quality, ontology representation with a CNV landscape summary over 51 distinctive National Cancer Institute Thesaurus cancer terms as well as updates in database schemas, and data access including new web front-end and programmatic data access.

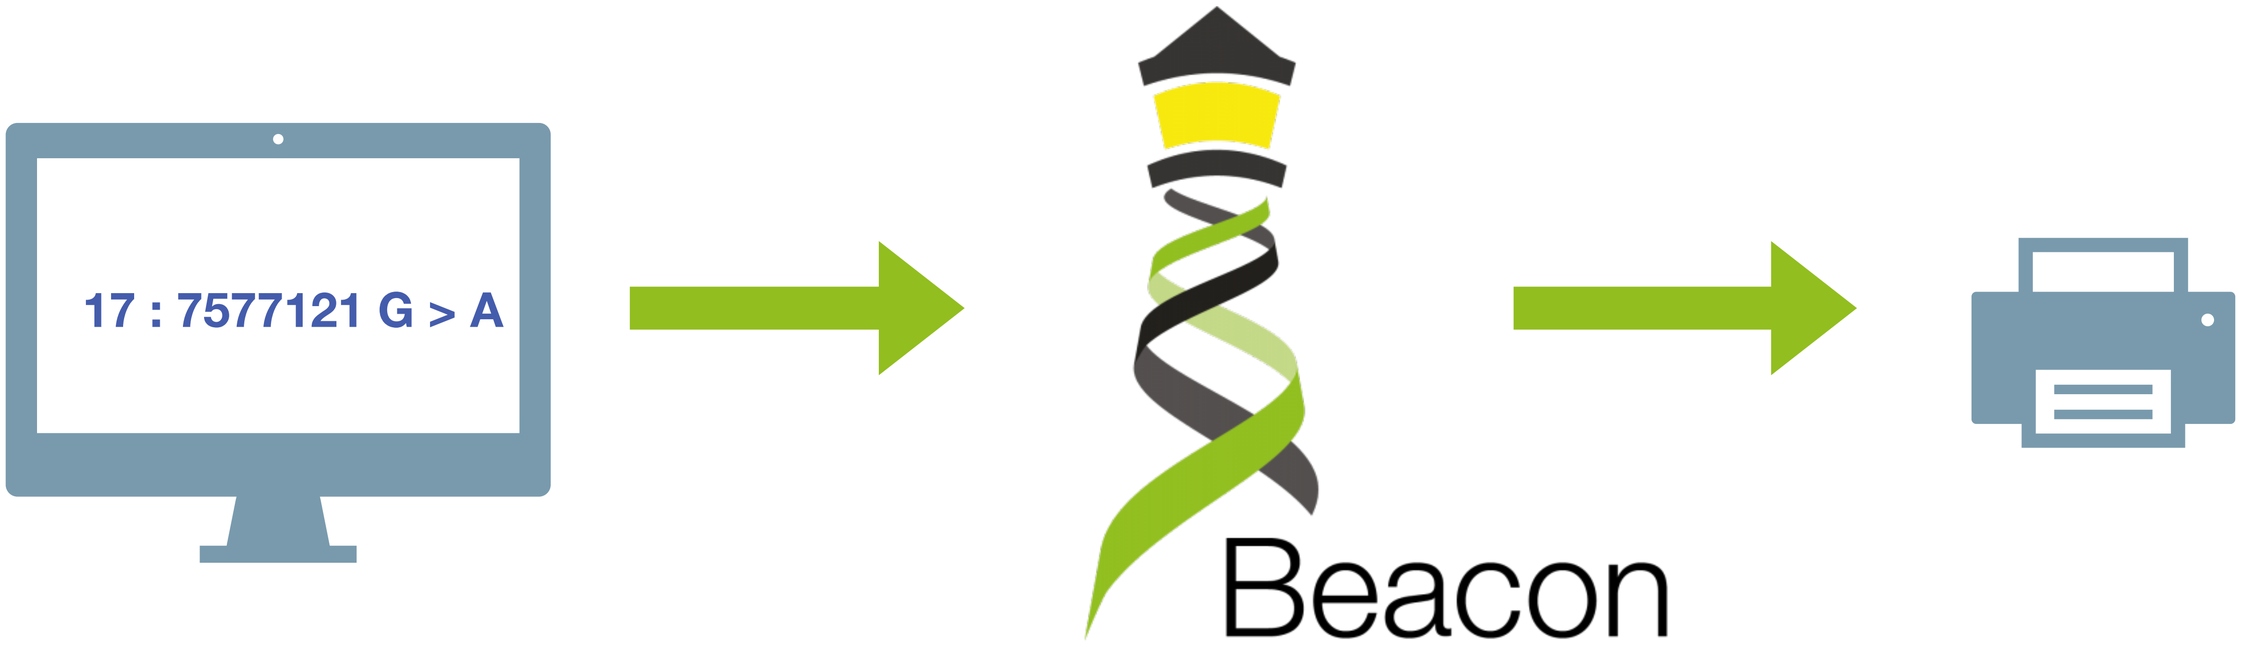
Global Alliance for Genomics & Health



A ***Beacon*** answers a query for a specific genome variant against individual or aggregate genome collections

YES | **NO** | **\0**

Global Alliance “Beacon” - Jim Ostell, NCBI, March 7, 2014

Global Alliance for Genomics & Health

Introduction

… I proposed a challenge application for all those wishing to seriously engage in *international* data sharing for human genomics. …

1. Provide a **public web service**
2. Which accepts a query of the form “Do you have **any** genomes with an “**A**” at position **100,735** on chromosome **3**?”
3. And responds with one of “**Yes**” or “**No**” …

“Beacon” because … people have been scanning the universe of human research for *signs of willing participants in far reaching data sharing*, but … it has remained a **dark** and **quiet** place. The hope of this challenge is to 1) *trigger the issues* blocking groups … in way that isn’t masked by the … complexities of the science, fully functional interfaces, and real issues of privacy, and to 2) in *short order* … see *real beacons of measurable signal* … from *at least some sites* … Once your “GABeacon” is shining, you can start to take the *next steps to add functionality* to it, and *finding the other groups* … following their GABeacons.

Utility

Some have argued that this simple example is not “useful” so nobody would build it. Of course it is not the first priority for this application to be scientifically useful. …intended to provide a *low bar for the first step of real … engagement*. … there is some utility in …locating a rare allele in your data, … not zero.

A number of more useful first versions have been suggested.

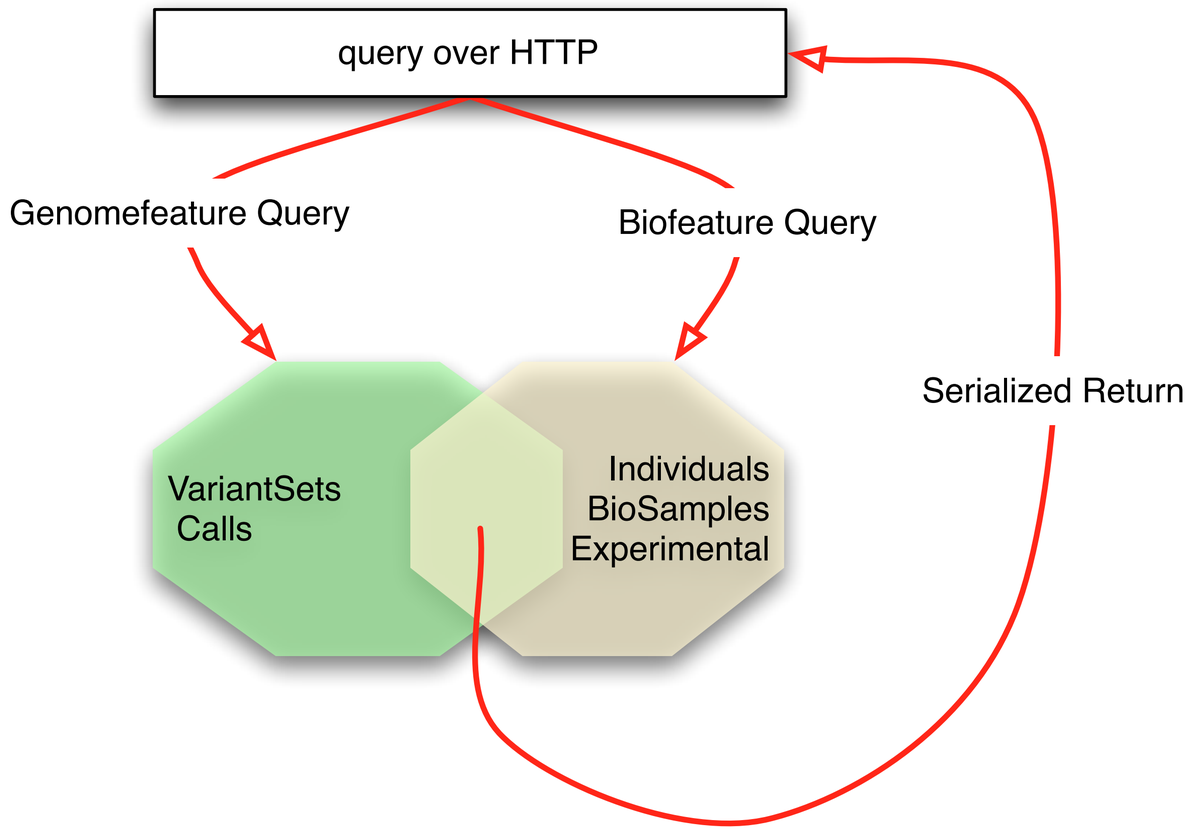
1. Provide *frequencies of all alleles* at that point
2. Ask for all alleles seen in a gene *region* (and more elaborate versions of this)
3. Other more complicated queries

"I would personally recommend all those be held for version 2, when the beacon becomes a service."
Jim Ostell, 2014

Implementation

1. Specifying the chromosome … The interface needs to specify the *accession.version* of a chromosome, or *build number*…
2. Return values … right to *refuse* to answer without it being an error … DOS *attack* … or because …especially *sensitive*…
3. Real time response … Some sites suggest that it would be necessary to have a *“phone home” response* …

Minimal GA4GH query API structure



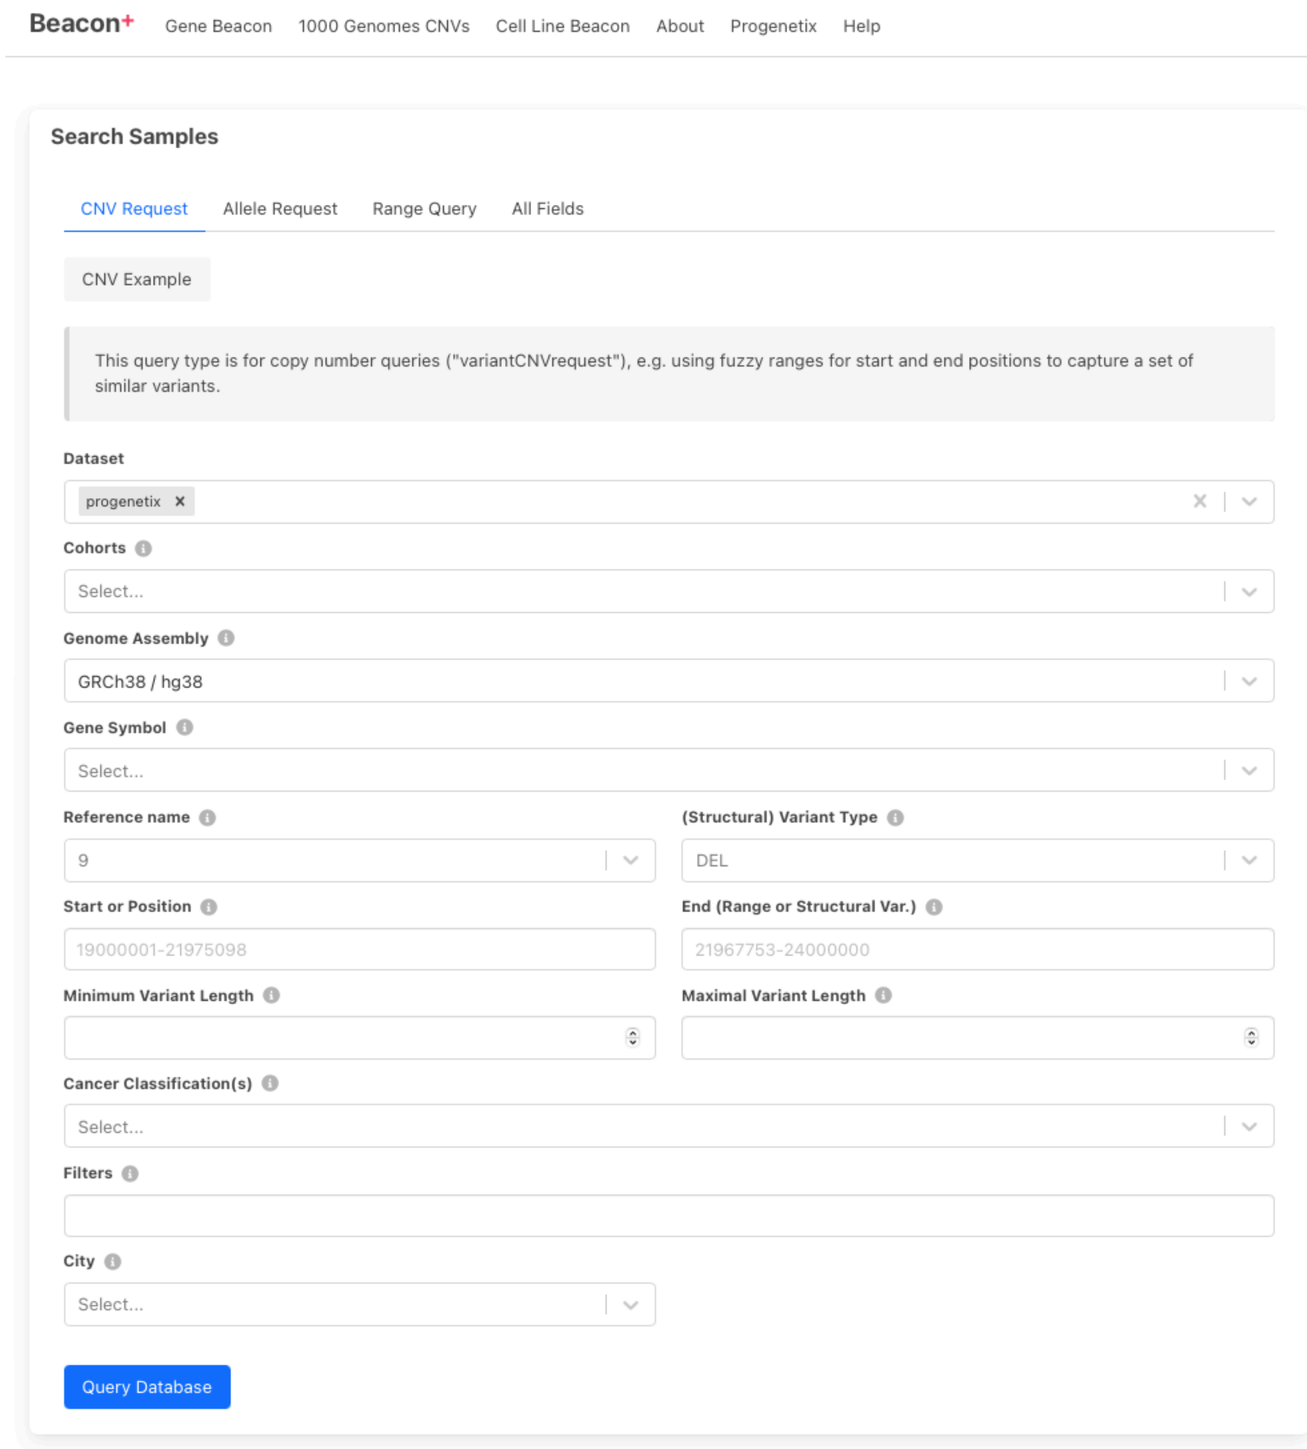
Beacon(+) “Metadata”

Beacon+ by Progenetix

From Beacon Query to Explorative Analyses of CNV Patterns

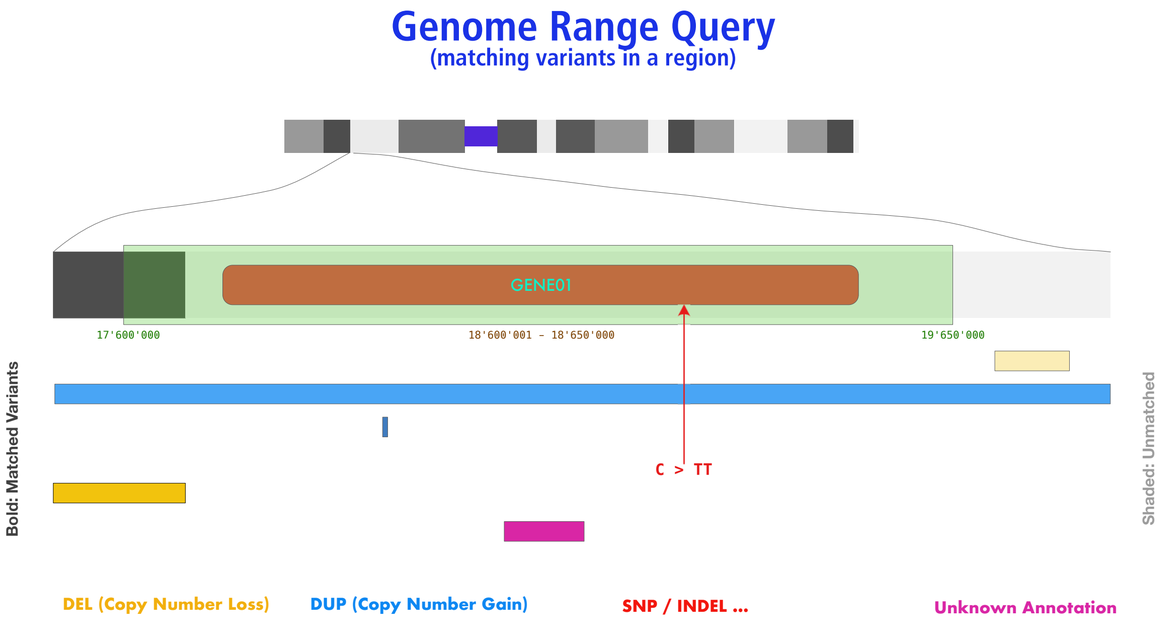
- Since 2016 the Progenetix resource has been used to model options for Beacon development
  - 138334 individual samples from 698 cancer types
- The consistent use of hierarchical diagnostic codes allows the use of Beacon "filters" for histopathological/clinically scoped queries
- Beacon's handover protocols can be utilized for data retrieval and, well, handing over to additional services, e.g.
  - downloads
  - visualization
  - use of external services (UCSC browser display...)

progenetix

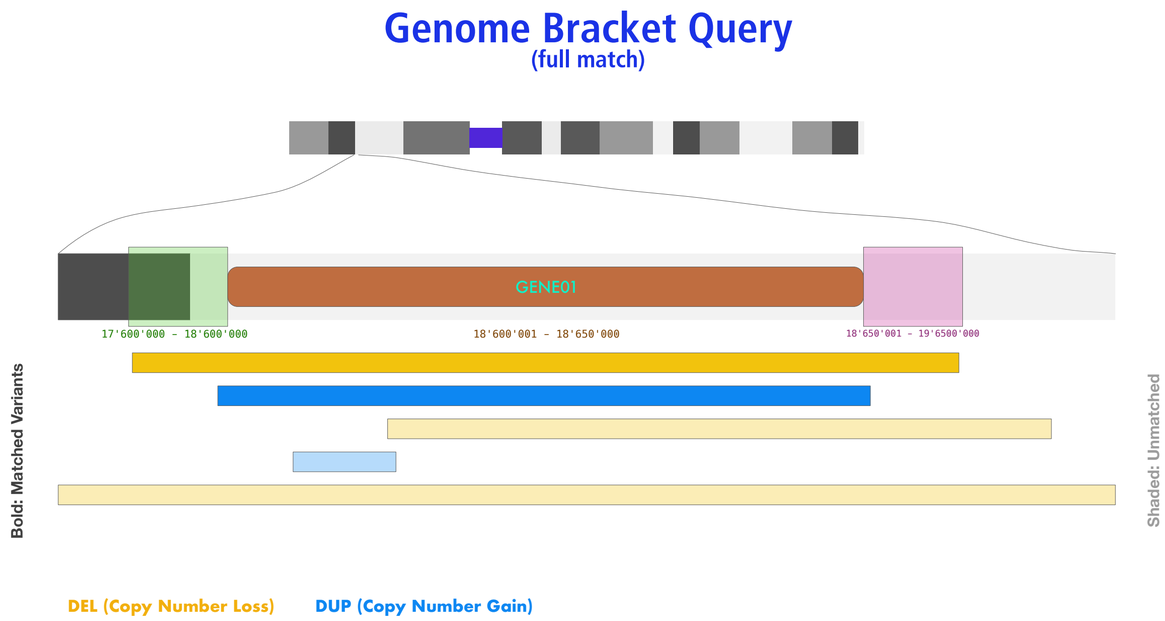


Beacon v2: Extended Variant Queries

Range and Bracket queries enable positional wildcards and fuzziness



- Genome Range Queries provide a way to "fish" for variants overlapping an indicated region, e.g. the CDR of a gene of interest
- Additional parameters (e.g. variant type, regerence or alternate bases) limit the scope of the responses
- new Beacon v2 size parameters to limit structural variants (e.g. "focal" CNVs)



- Genome Bracket Queries allow to search for structural variants with start and end positions falling into defined sequence ranges
- allows to query any contiguous genomic variant (and in principle also can step in for range queries)
- typical use case is e.g the query for variants such as duplications covering the whole CDR of a gene, while limiting the allowed start or end regions

Beacon v2 Filters

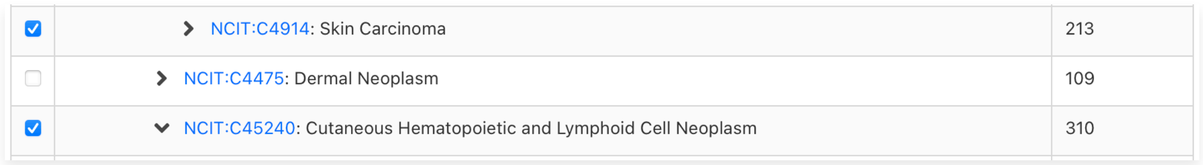
Example: Use of hierarchical classification systems (here NCIt neoplasm core)

- Beacon v2 "filters" assumes inclusion of child terms when using hierarchical classifications

  ➡ implicit *OR* with otherwise assumed *AND*

- implementation of hierarchical annotations overcomes some limitatiions of "fuzzy" disease annotations

Beacon+ specific: Multiple term selection with OR logic



Filters: NCIT:C4914, NCIT:C4819, NCIT:C9231, NCIT:C2921, NCIT:C45240, NCIT:C6858, NCIT:C3467, NCIT:C45340, NCIT:C7195, NCIT:C3246, NCIT:C7217

Beacon v2 Requests

POSTing Queries

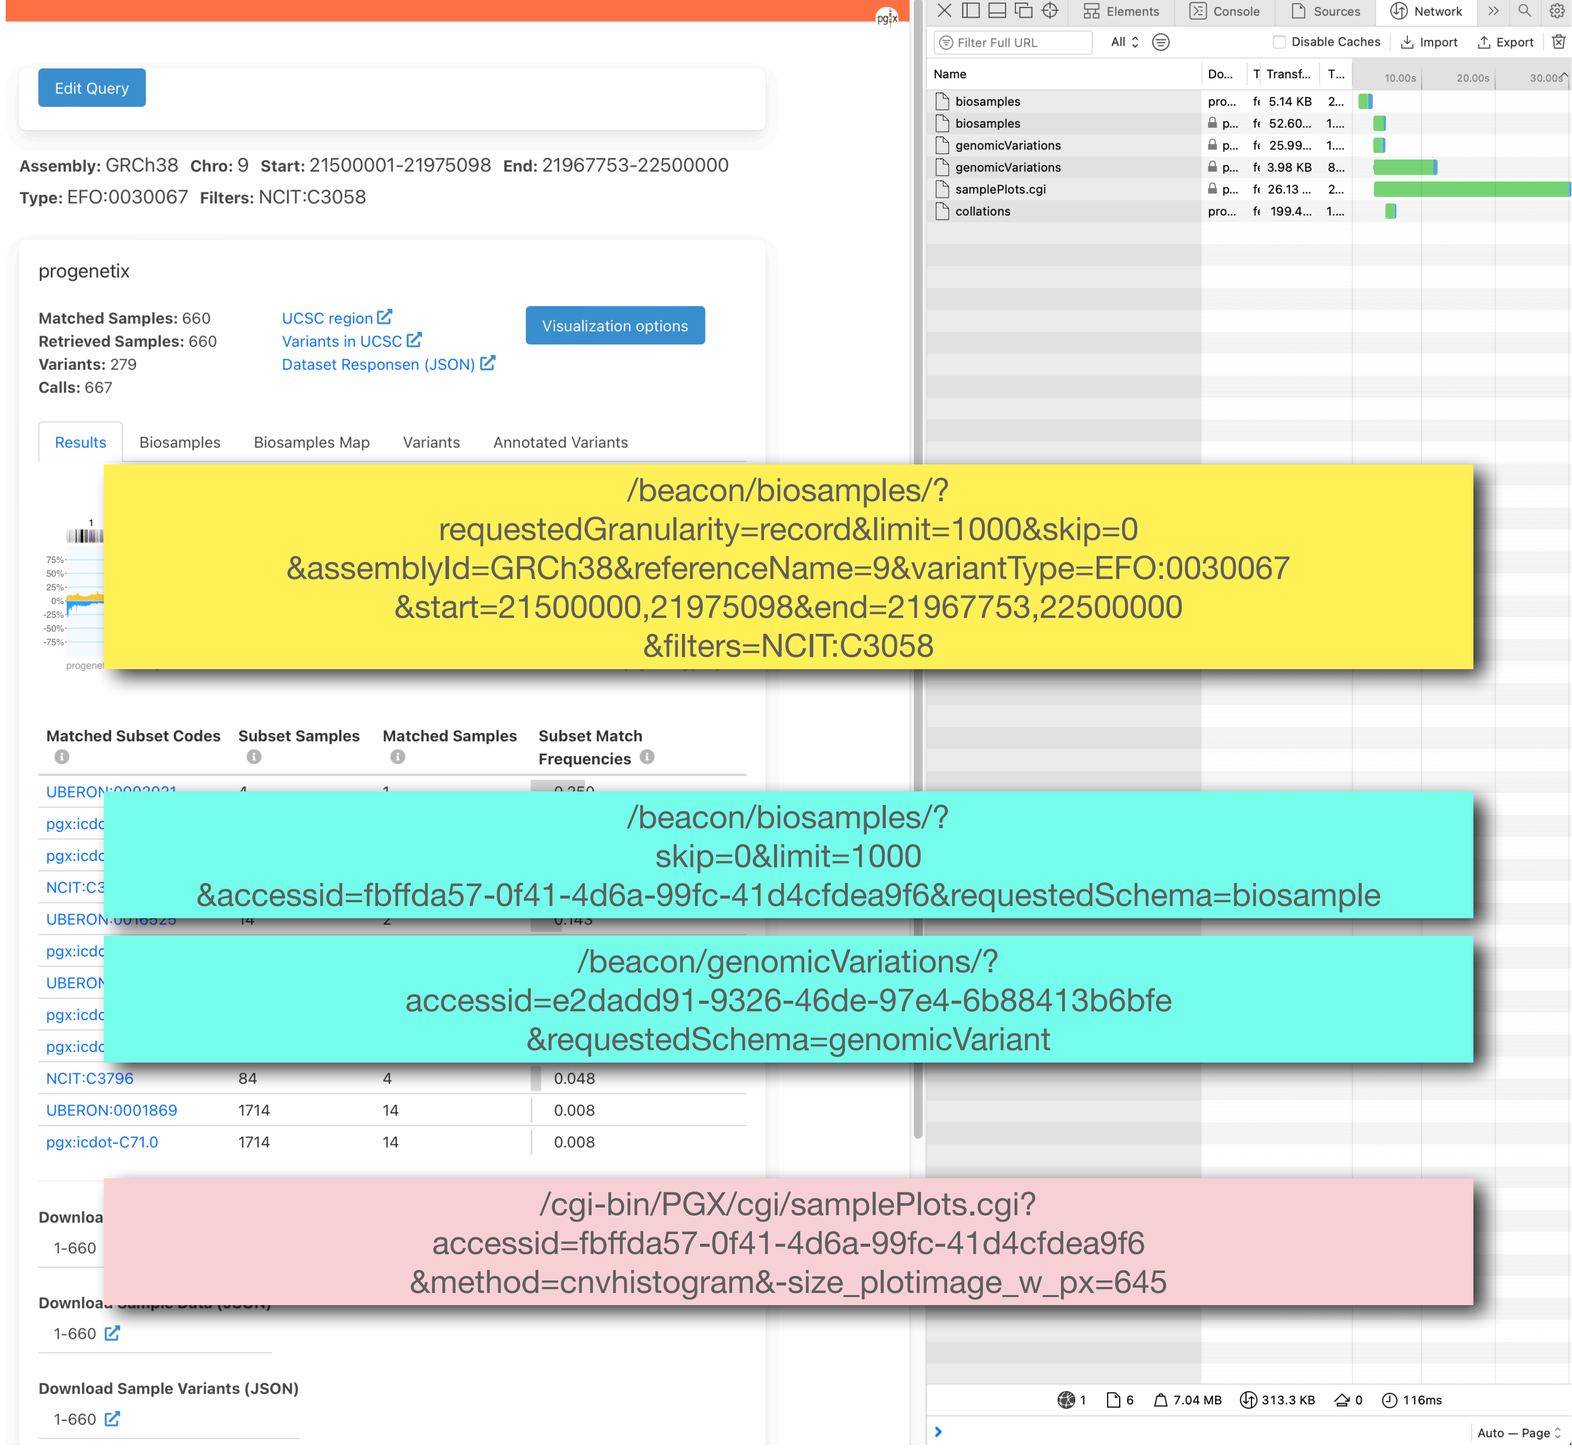
- Beacon v2 supports a mix of dedicated endpoints with REST paths
- POST requests using JSON query documents
- final syntax for core parameters still in testing stages

```
{
    "$schema":"beaconRequestBody.json",
    "meta": {
        "apiVersion": "2.0",
        "requestedSchemas": [
            {
                "entityType": "individual",
                "schema": "https://progenetix.org/services/schemas/Phenopacket/"
            }
        ]
    },
    "query": {
        "requestParameters": {
            "datasets": {
                "datasetIds": ["progenetix"]
            }
        },
        "filterLogic": "OR"
    },
    "pagination": {
        "skip": 0,
        "limit": 10
    },
    "filters": [
        { "id": "NCIT:C4536" },
        { "id": "NCIT:C95597" },
        { "id": "NCIT:C7712" }
    ]
}
```

Progenetix

Genomic resource utilizing Beacon v2 calls

- Progenetix uses Beacon v2 queries to drive its UI
- all individuals, biosamples, variants, analyses matched by a given query are stored by their object ids
- handovers for variant purposes (e.g. to retrieve all matched variants) are returned in the original response and asynchronously retrieved by the front end app



Beacon v2 Paths

Progenetix utilizes Beacon v2 REST paths

- Beacon v2 paths are used in the Beacon specification to scope query and delivery
- Progenetix uses a default /biosamples/ + query path for its front end queries, and then collection specific methods for data retrieval (see next)
- current implementation addresses a core subset of all options, and evaluates some still moving targets
  - ➡ variants_interpretations
  - ➡ variant instances versus prototypes
  - ➡ ...

progenetix

Base `/biosamples`

`/biosamples/` + query

- /biosamples/?filters=cellosaurus:CVCL_0004
  - this example retrieves all biosamples having an annotation for the Cellosaurus *CVCL_0004* identifier (K562)

`/biosamples/{id}/`

- /biosamples/pgxbs-kftva5c9/
  - retrieval of a single biosample

`/biosamples/{id}/variants/` & `/biosamples/{id}/variants_in_sample/`

- /biosamples/pgxbs-kftva5c9/variants/
- /biosamples/pgxbs-kftva5c9/variants_in_sample/
  - retrieval of all variants from a single biosample
  - currently - and especially since for a mostly CNV containing resource - `variants` means "variant instances" (or as in the early v2 draft `variantsInSample`)

Base `/variants`

There is currently (April 2021) still some discussion about the implementation and naming of the different types of genomic variant endpoints. Since the Progenetix collections follow a "variant observations" principle all variant requests are directed against the local `variants` collection.

If using `g_variants` or `variants_in_sample`, those will be treated as aliases.

`/variants/` + query

- /variants/?assemblyId=GRCh38&referenceName=17&variantType=DEL&filterLogic=AND&start=7500000&start=7676592&end=7669607&end=7800000
  - This is an example for a Beacon "Bracket Query" which will return focal deletions in the TP53 locus (by position).

`/variants/{id}/` or `/variants_in_sample/{id}` or `/g_variants/{id}/`

- /variants/5f5a35586b8c1d6d377b77f6/
- /variants_in_sample/5f5a35586b8c1d6d377b77f6/

`/variants/{id}/biosamples/` & `variants_in_sample/{id}/biosamples/`

- /variants/5f5a35586b8c1d6d377b77f6/biosamples/
- /variants_in_sample/5f5a35586b8c1d6d377b77f6/biosamples/

Bycon - a Python-based environment for the Beacon v2 genomics API
The bycon project - at least at its current stage - is a mix of Progenetix (i.e. GA4GH object model derived, MongoDB implemented) - data management, and the implementation of middleware & server for the Beacon API.
More information about the current status of the package can be found in the inline documentation which is also presented in an accessible format on the Progenetix website.

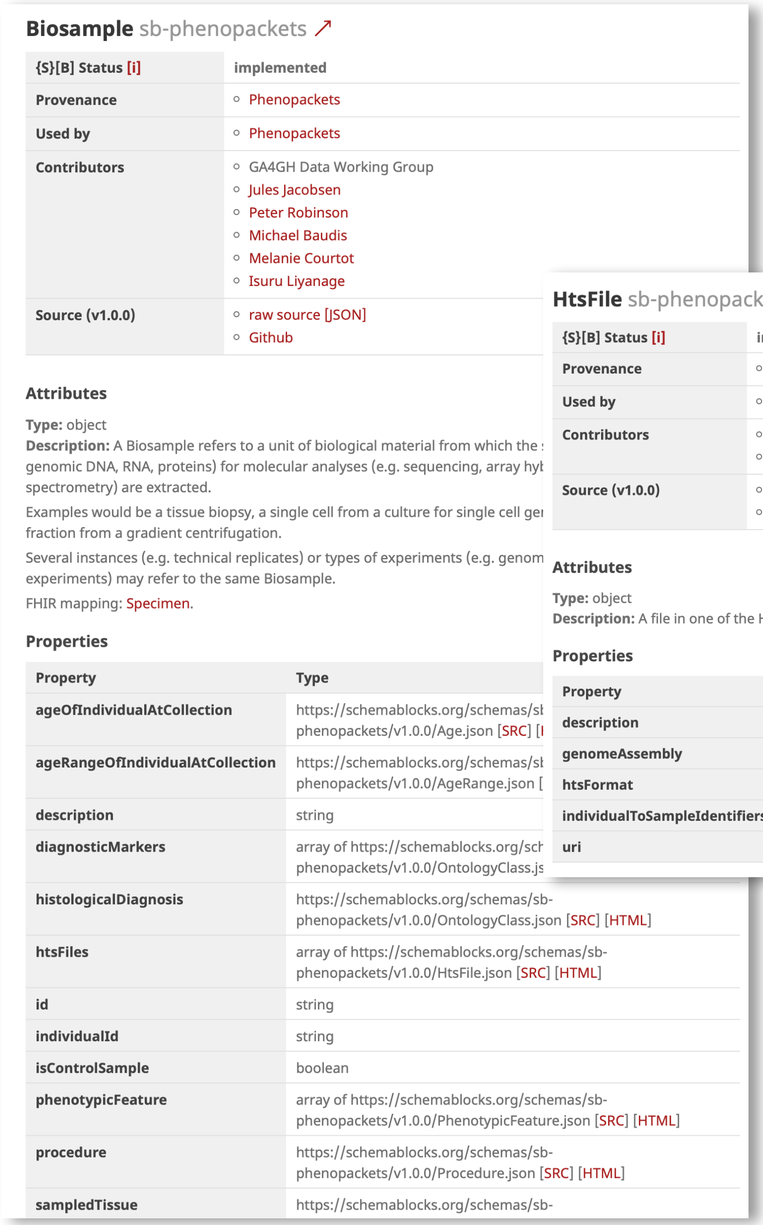
GA4GH {S}[B] *SchemaBlocks*

Standardized formats and data schemas for developing an "Internet of Genomics"

- “cross-workstreams, cross-drivers” initiative to document GA4GH object **standards** and **prototypes** launched in December 2018
- documentation and implementation examples provided by GA4GH members
- not a rigid, complete data schema
- object **vocabulary** and **semantics** for a large range of developments
- **Beacon** as contributor and user
- 2021: going forward through integration with GA4GH TASC efforts, towards "standards library"



Biosample sb-phenopackets ↗

Attributes

Type: object
Description: A Biosample refers to a unit of biological material from which the
genomic DNA, RNA, proteins) for molecular analyses (e.g. sequencing, array hyb
spectrometry) are extracted.

Examples would be a tissue biopsy, a single cell from a culture for single cell ge
fraction from a gradient centrifugation.

Several instances (e.g. technical replicates) or types of experiments (e.g. genom
experiments) may refer to the same Biosample.

FHIR mapping: Specimen.

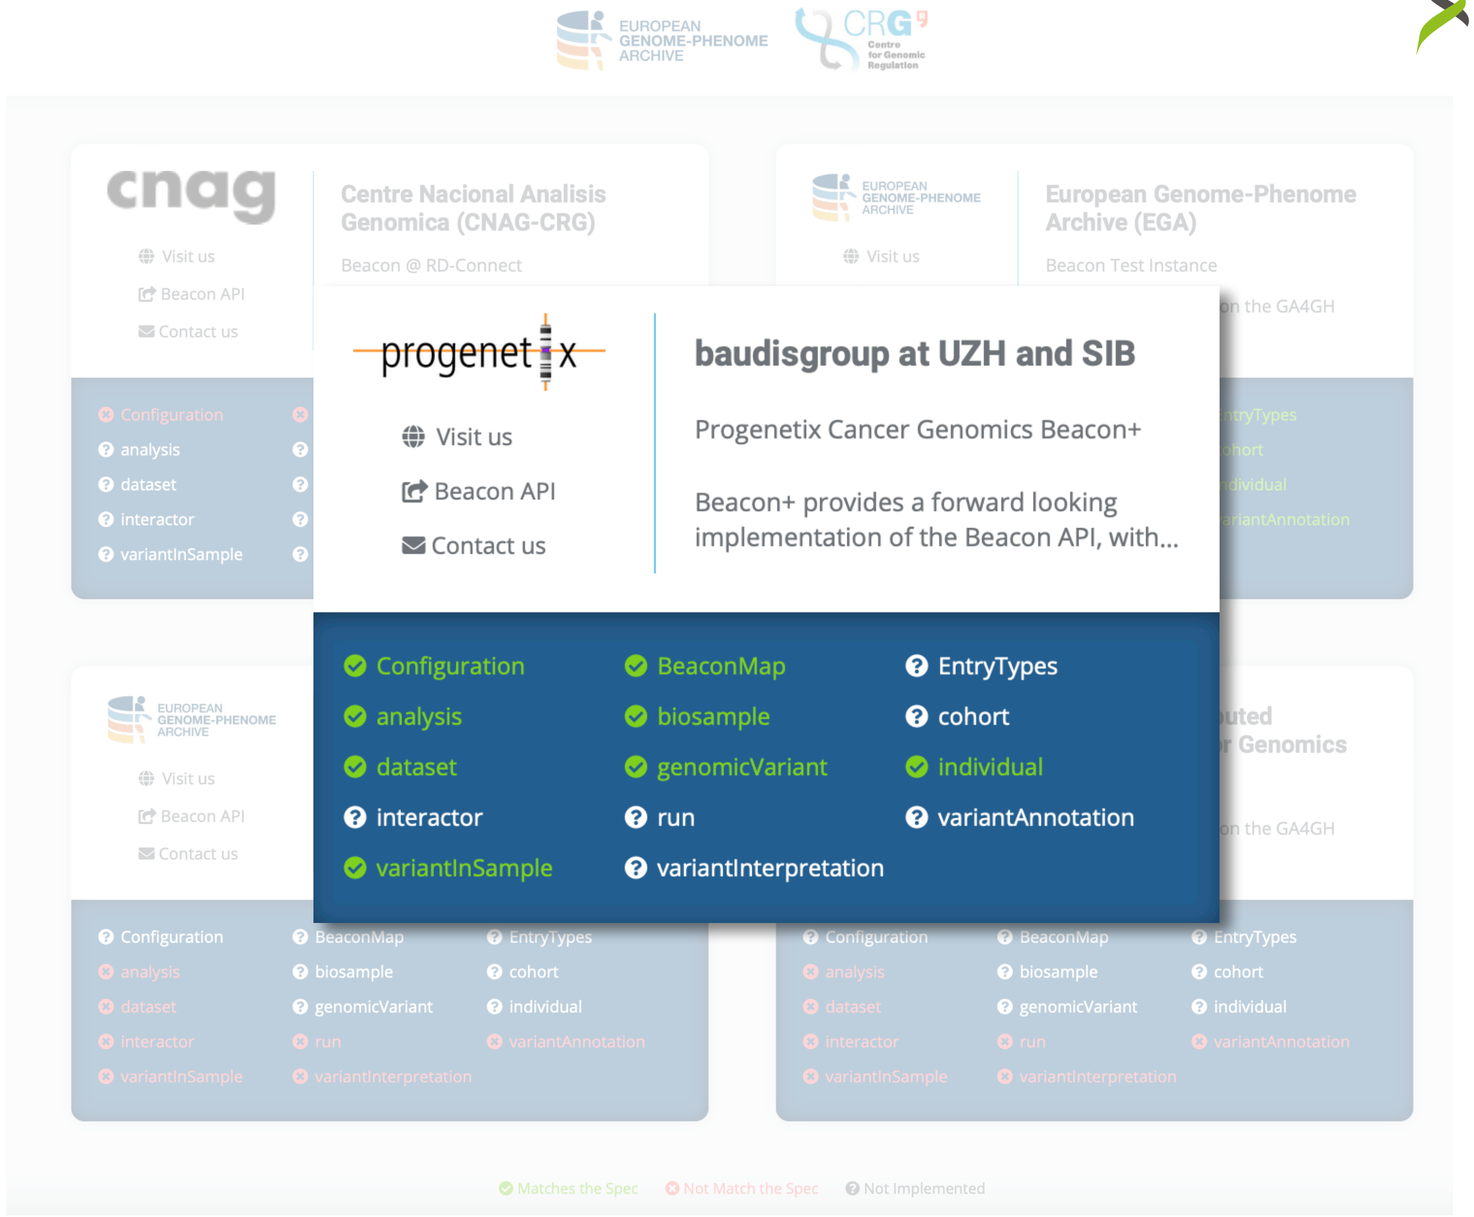
Onboarding

Demonstrating Compliance

- Progenetix Beacon+ has served as implementation driver since 2016
- Beacon v2 as service with protocol-driven registries for federation
- GA4GH approval process in the Spring 2022 session



Global Alliance for Genomics & Health

A cancer genomics reference resource and implementation toolkit around GA4GH standards

Rahel Paloots, Ziying Yang, Hangjia Zhao, Qingyao Huang and Michael Baudis

Department of Molecular Life Sciences and Swiss Institute of Bioinformatics, University of Zurich, Switzerland

The *Progenetix* Oncogenomics Resource

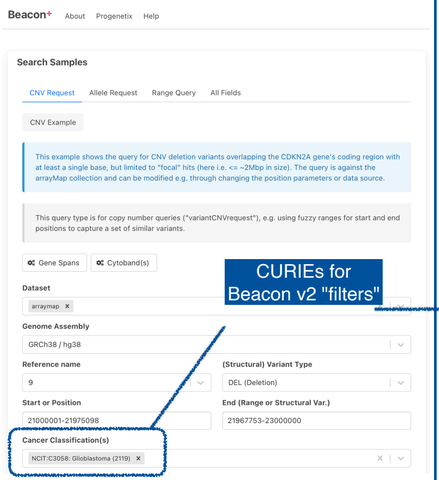
The Progenetix oncogenomics resource provides sample-specific cancer genome profiling data and biomedical annotations as well as provenance data for cancer studies. Especially through more than 100k genomic copy number number (CNV) profiles from over 500 cancer types, Progenetix empowers comparative analyses vastly exceeding individual studies and diagnostic concepts.

Progenetix has been used in research studies, clinical diagnostics and in the development of data standards for the Global Alliance for Genomics and Health (GA4GH) and the European bioinformatics initiative ELIXIR. The resource's focus on structural genome variants has been instrumental in addressing their specific requirements in GA4GH schema development and the Beacon protocol.

Database URL progenetix.org

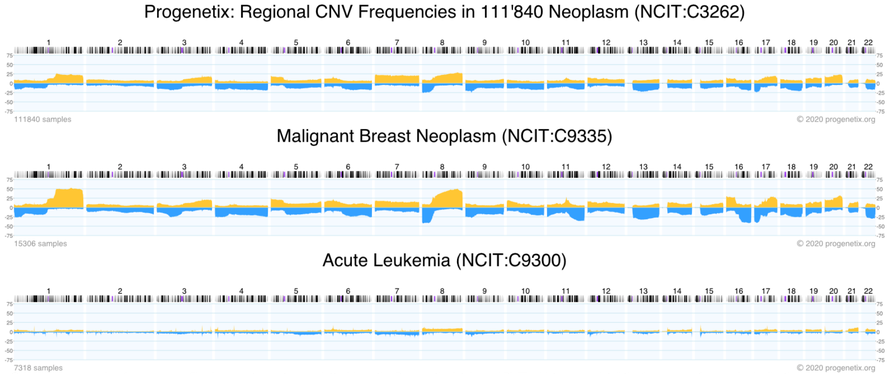
License CC-BY 4.0 (CC0 for code)

Beacon+ drives Beacon v2 API development



*Beacon+ - built on top of the Progenetix infrastructure - has been instrumental in developing and testing Beacon extensions such as **structural variant** queries and **handover** data delivery (v1.n) or **filters** for querying biological and technical annotations (v2.n).*

Progenetix provides regional CNV frequency profiled for most cancer types



Genomic copy number frequency profiles in some tumor types, plotted from the Progenetix database API. The histograms detail the frequency of genomic duplications/amplifications (yellow; up) and deletions (blue, down) for the corresponding region in a given tumor type or all samples (top).

New Cancer Cell Lines Feature

Int. ID	Digest	Biosample	Chr.	Ref. Base(s)	Alt. Base(s)

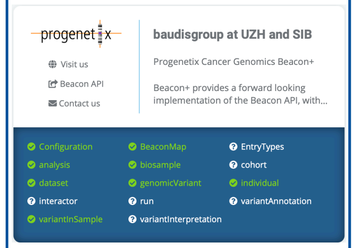
We have built a new resource representing cancer cell line single nucleotide variants. It is in alignment with the Beacon protocol and is also incorporating GA4GH variant annotations workflow.

The Progenetix Cell Line Beacon represents cell line variants with their known positions. These variants also include known disease ontologies such as Orphanet, MedGen etc.

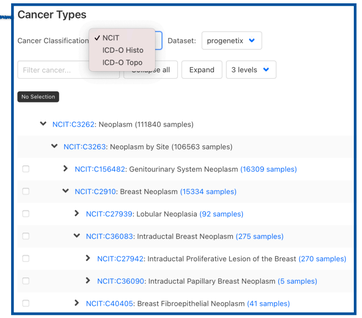
Beacon v2 test registry for upcoming GA4GH standard



Modern Hierarchical Ontologies for Flexible Data Use

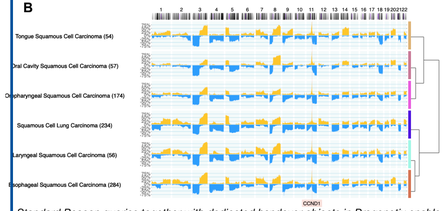
During development of GA4GH metadata concepts and schemas - which influenced standards such as the Phenopackets format - cancer specific annotations from Progenetix have informed conceptual requirements and domain-specific mappings.

In Progenetix the systematic integration of "classical" property codes (e.g. International Classification of Diseases in Oncology; ICD-O 3) and their translation into hierarchical ontologies with registered identifiers (e.g. NCIt Neoplasm Core, MONDO, EFO...) empowers internal data structures as well as federated query implementations such as through Beacon v2 "filters".

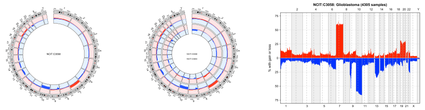


Beacon v2 as Progenetix Data API

The Beacon v2 compatible Progenetix API provides download and data visualization options, with standardized JSON responses and data handling facilitated trough extensions like the ***pgxRpi*** libray.



Standard Beacon queries together with dedicated handover objects in Progenetix enable a variety of services: variant display in the UCSC browser, sample data download (above); retrieval sample of specific genome profiles for subgroup visualization (B).



Visualization of CNV features using the recently introduced pgxRpi R package. Here, aggregated CNV data for single or two (center) cancer types using Circos or frequency plots in a local R environment.

Conclusion

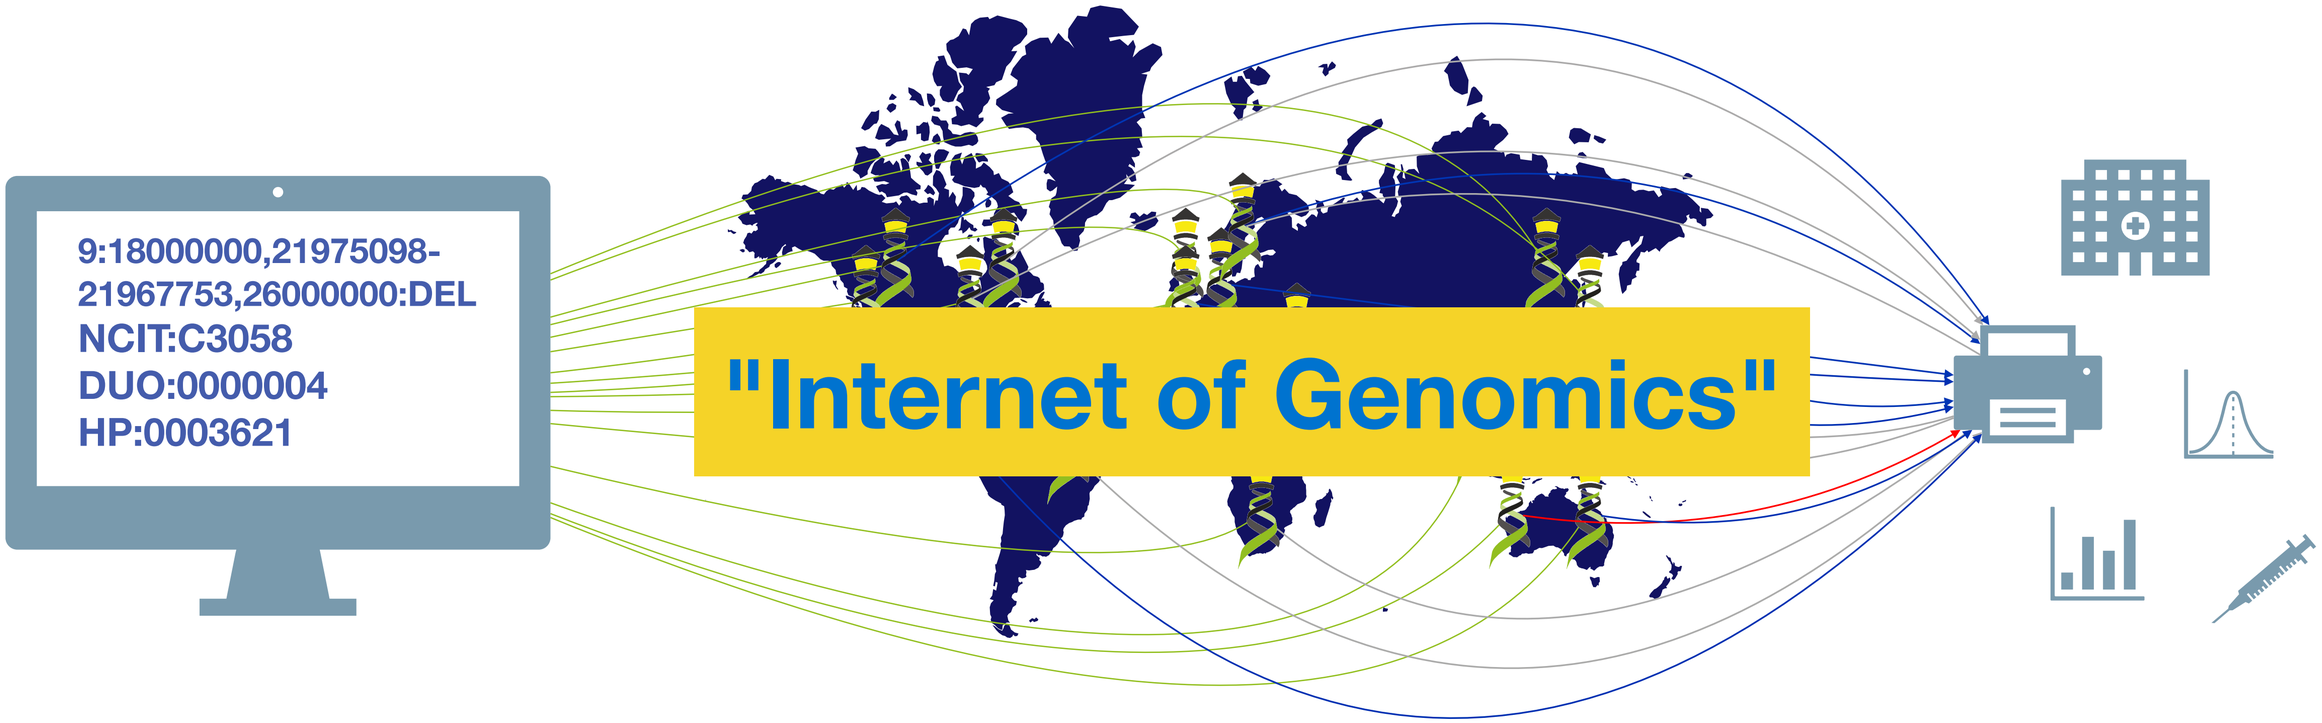
We demonstrate how an open genomic reference resource has been built around emerging GA4GH standards and how it is being used to support ongoing and future developments in GA4GH and ELIXIR implementation studies, including an introduction about utilizing the Progenetix code repositories for genomics resource development.

For more information please visit progenetix.org and the code repositories at github.com/progenetix

Have you seen deletions in this region on chromosome 9 in Glioblastomas from a juvenile patient, in a dataset with unrestricted access?

Beacon *v2* API

The Beacon API v2 proposal opens the way for the design of a simple but powerful "**genomics API**".



Have you seen deletions in this region on chromosome 9 in Glioblastomas from a juvenile patient, in a dataset with unrestricted access?

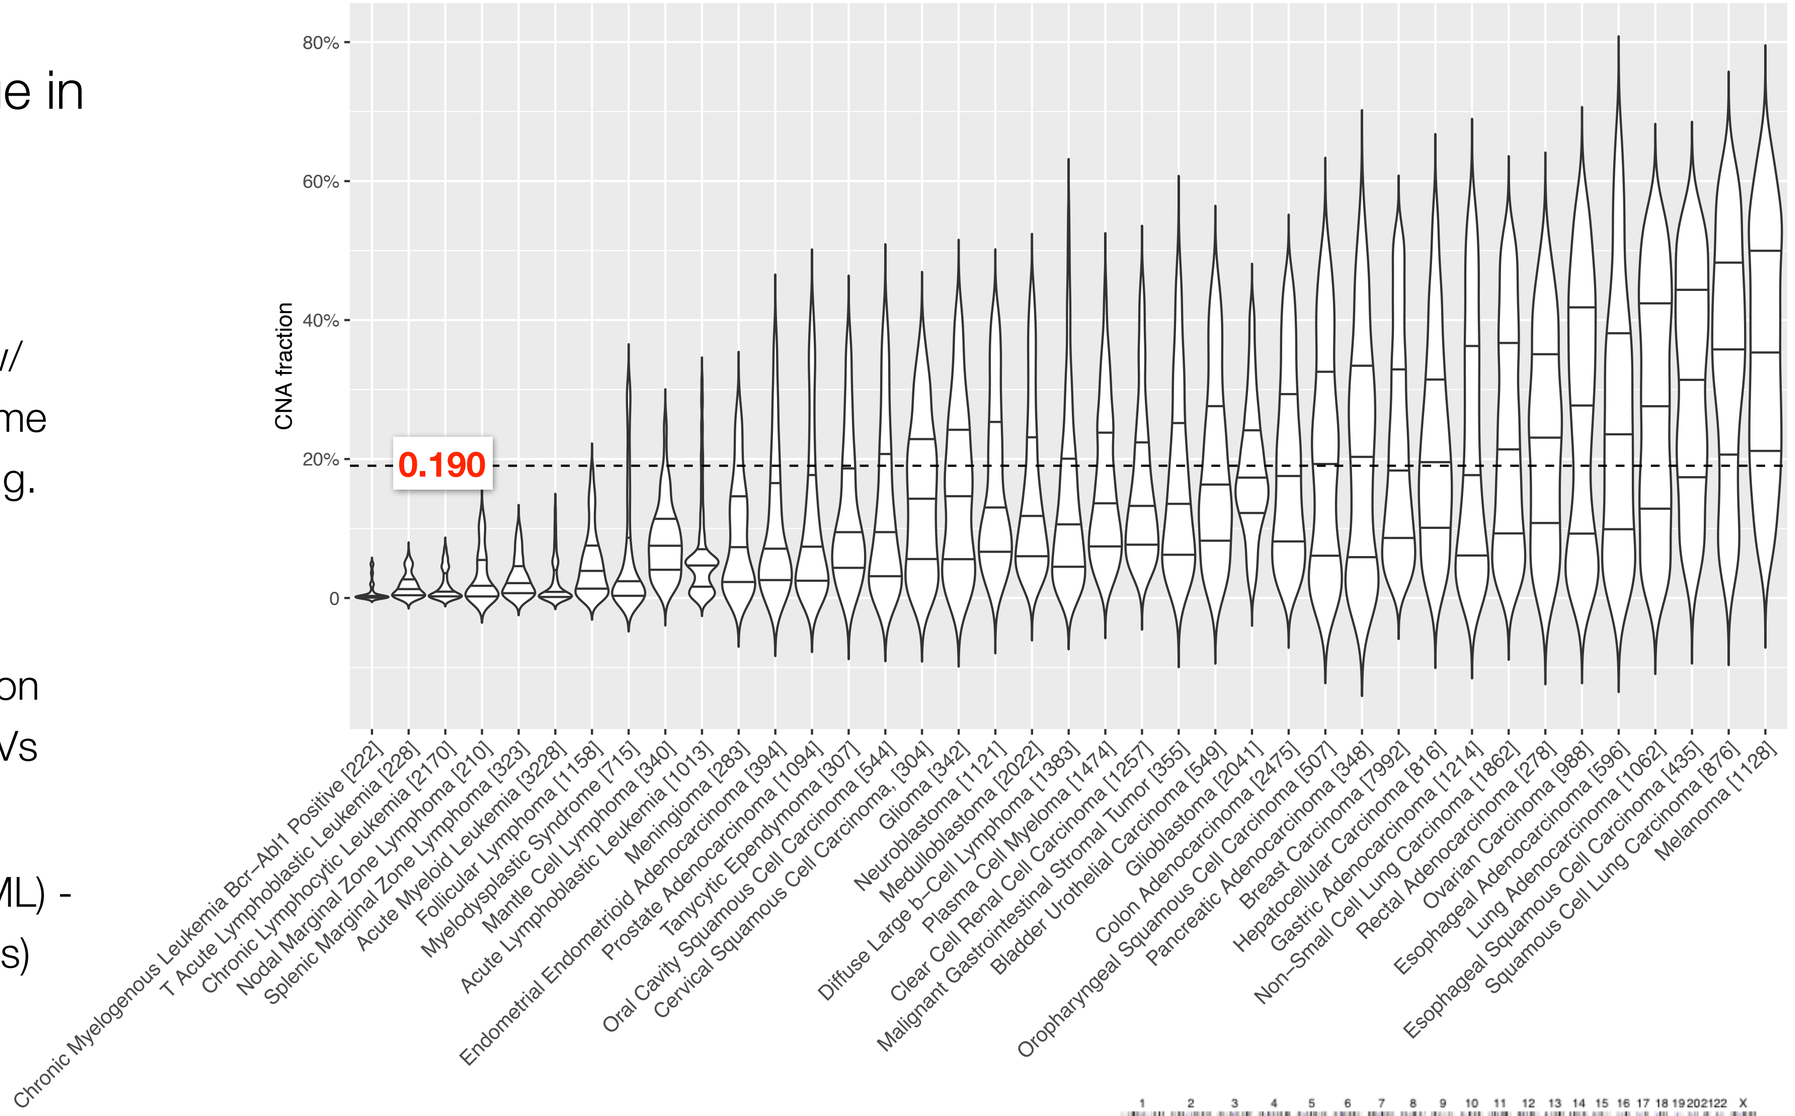
Beacon *v2* API

The Beacon API v2 proposal opens the way for the design of a simple but powerful "**genomics API**".

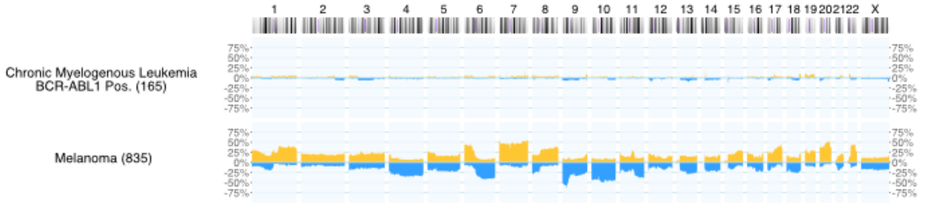
Data Use Cases

Genome CNV coverage in Cancer Classes

- 43654 out of 93640 CNV profiles; filtered for entities w/ >200 samples (removed some entities w/ high CNV rate, e.g. sarcoma subtypes)
- Single-sample CNV profiles were assessed for the fraction of the genome showing CNVs (relative gains, losses)
- range of medians 0.001 (CML) - 0.358 (malignant melanomas)



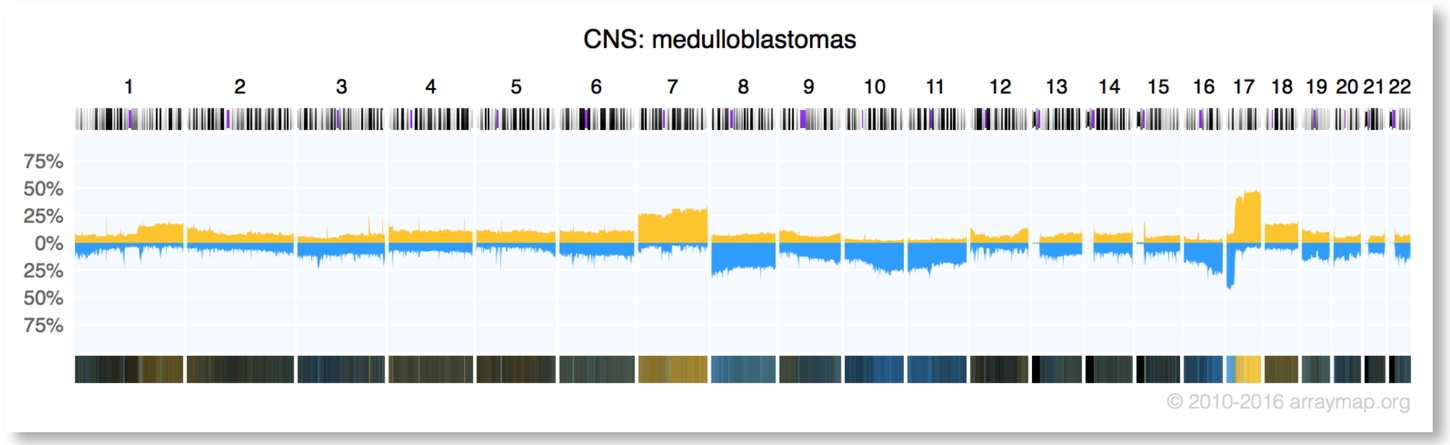
Lowest / Highest CNV fractions =>

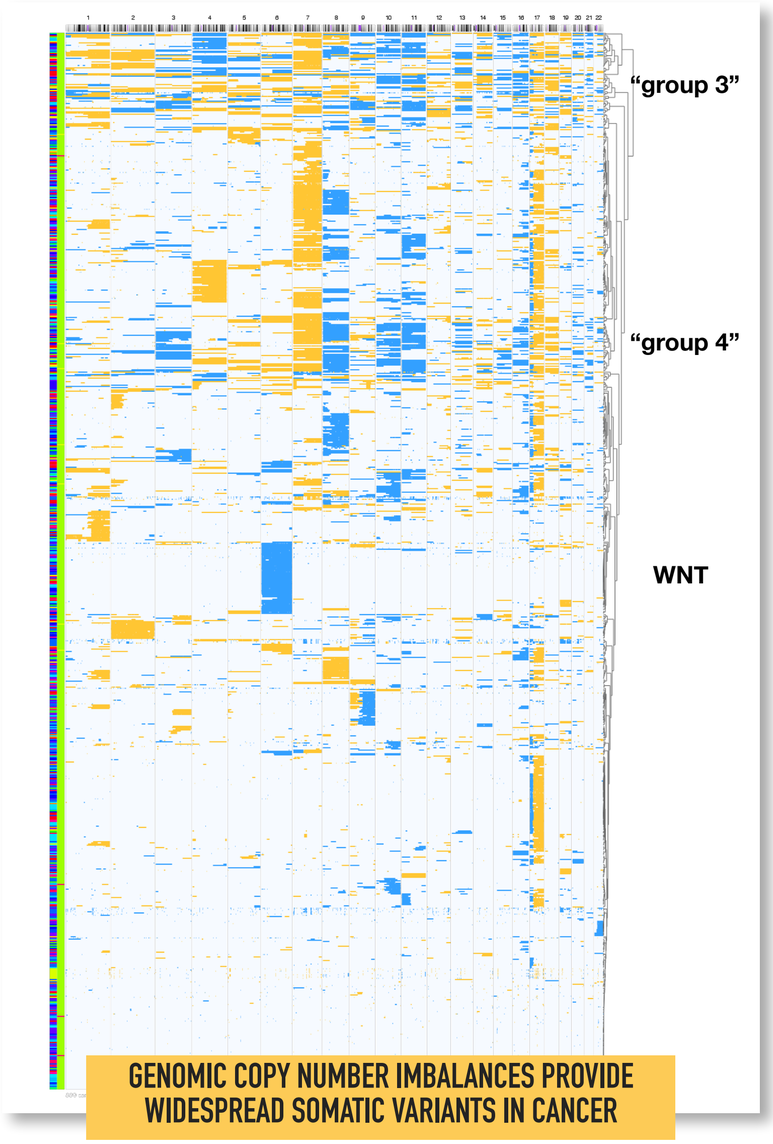


Somatic CNVs In Cancer

Recurrent mutation patterns

How can those patterns be used for classification and determination of biological mechanisms?





A genomic copy number histogram for malignant medulloblastomas, the most frequent type of pediatric brain tumors, displaying regions of genomic duplications and deletions. These can be decomposed into individual tumor profiles which segregate into several clusters of related mutation patterns with functional relevance and clinical correlation.

Signatures of Discriminative Copy Number Aberrations in 31 Cancer Subtypes

Bo Gao [1,2] *and Michael Baudis* [1,2*]

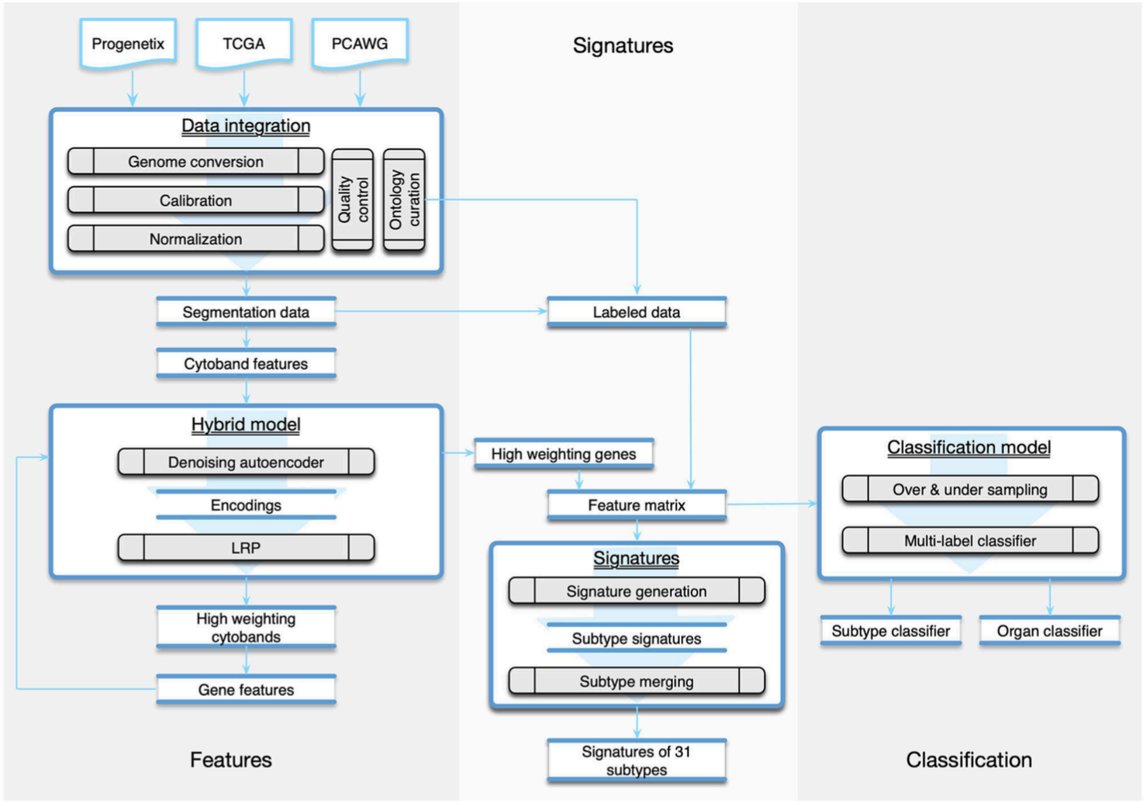

FIGURE 1 | The workflow of the study was composed of three parts. The *Features* part consisted of methods of data integration and feature generation. The *Signature* part focused on creating CNA signatures for cancer subtypes and the categorization of subtypes. The *Classification* part recruited machine learning techniques to predict the organ and the subtype from a given copy number profile.

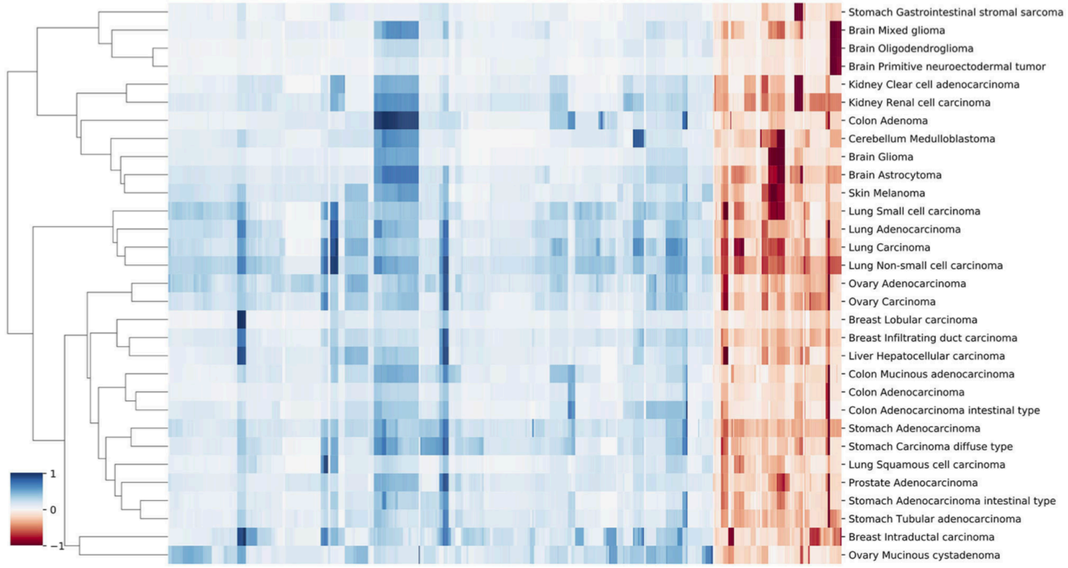

FIGURE 5 | A clustering heatmap of features in 31 signatures. Columns are normalized average CNV intensities of feature genes, where the blue colors are duplication features and red colors are deletion features. Duplication and deletion frequencies are normalized separately.

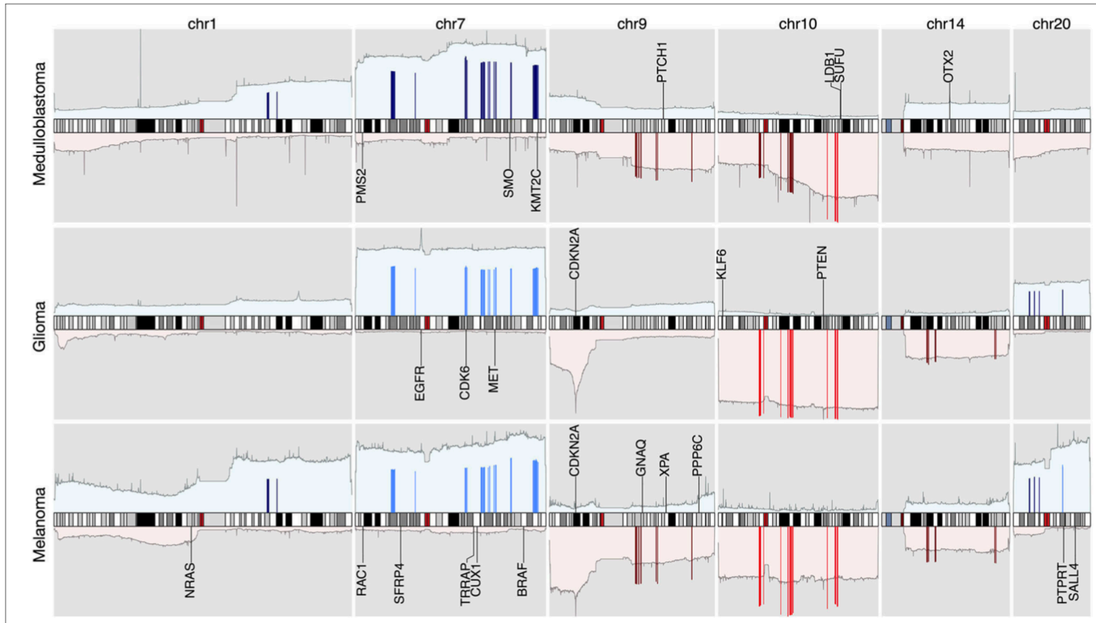

FIGURE 6 | The integrated view of the original data and the selected features, in the neural crest originating entities medulloblastoma, glioma, and melanoma. The shaded background area color illustrates the original data. Color bars illustrate the feature genes, where brighter colors indicate stronger signal intensity. The blue colors above the chromosome axis represent the average amplifications, and the red colors below the chromosome axis represent the average deletions. The amplitude of amplifications and deletions are normalized to [0,1] separately. The adjacent known driver genes are also included for each tumor type.

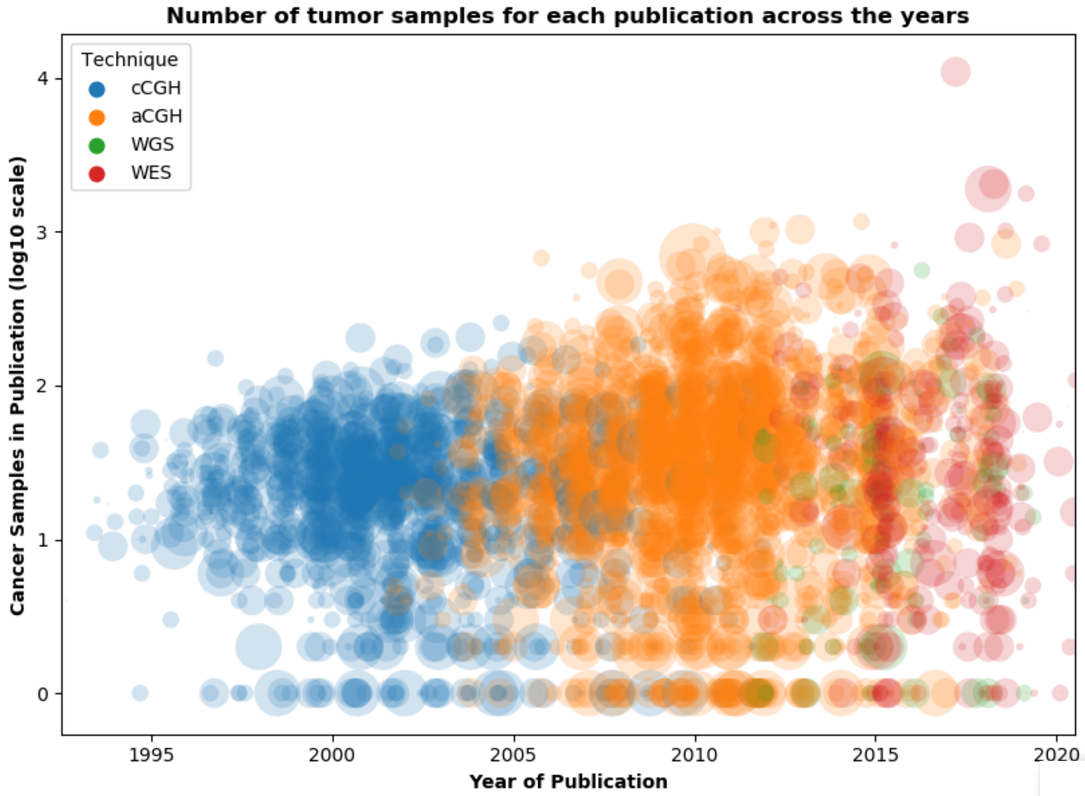

Map of the geographic distribution (by first author affiliation) of the 104'543 genomic array, 36'766 chromosomal CGH and 15'409 whole genome/exome based cancer genome datasets.

The numbers are derived from the 3'240 publications registered in the Progenetix database.

Progenetix Publication Collection

The current page lists articles describing whole genome screening (WGS, WES, aCGH, cCGH) experiments in cancer, registered in the Progenetix publication collection. For each publication the table indicates the numbers of samples analysed with a given technology and if sample profiles are available in Progenetix.

Please contact us to alert us about additional articles you are aware of. The inclusion criteria are described in the documentation.

Population stratification in cancer samples based on SNP array data

- Despite extensive somatic mutations of cancer profiling data, consistency between germline and cancer samples reached 97% and 92% for 5 and 26 populations
- Comparison of our benchmarked results with self-reported meta-data estimated a matching rate between 88 % to 92%.
- Ethnicity labels indicated in meta-data are vague compared to the standardized output from our tool

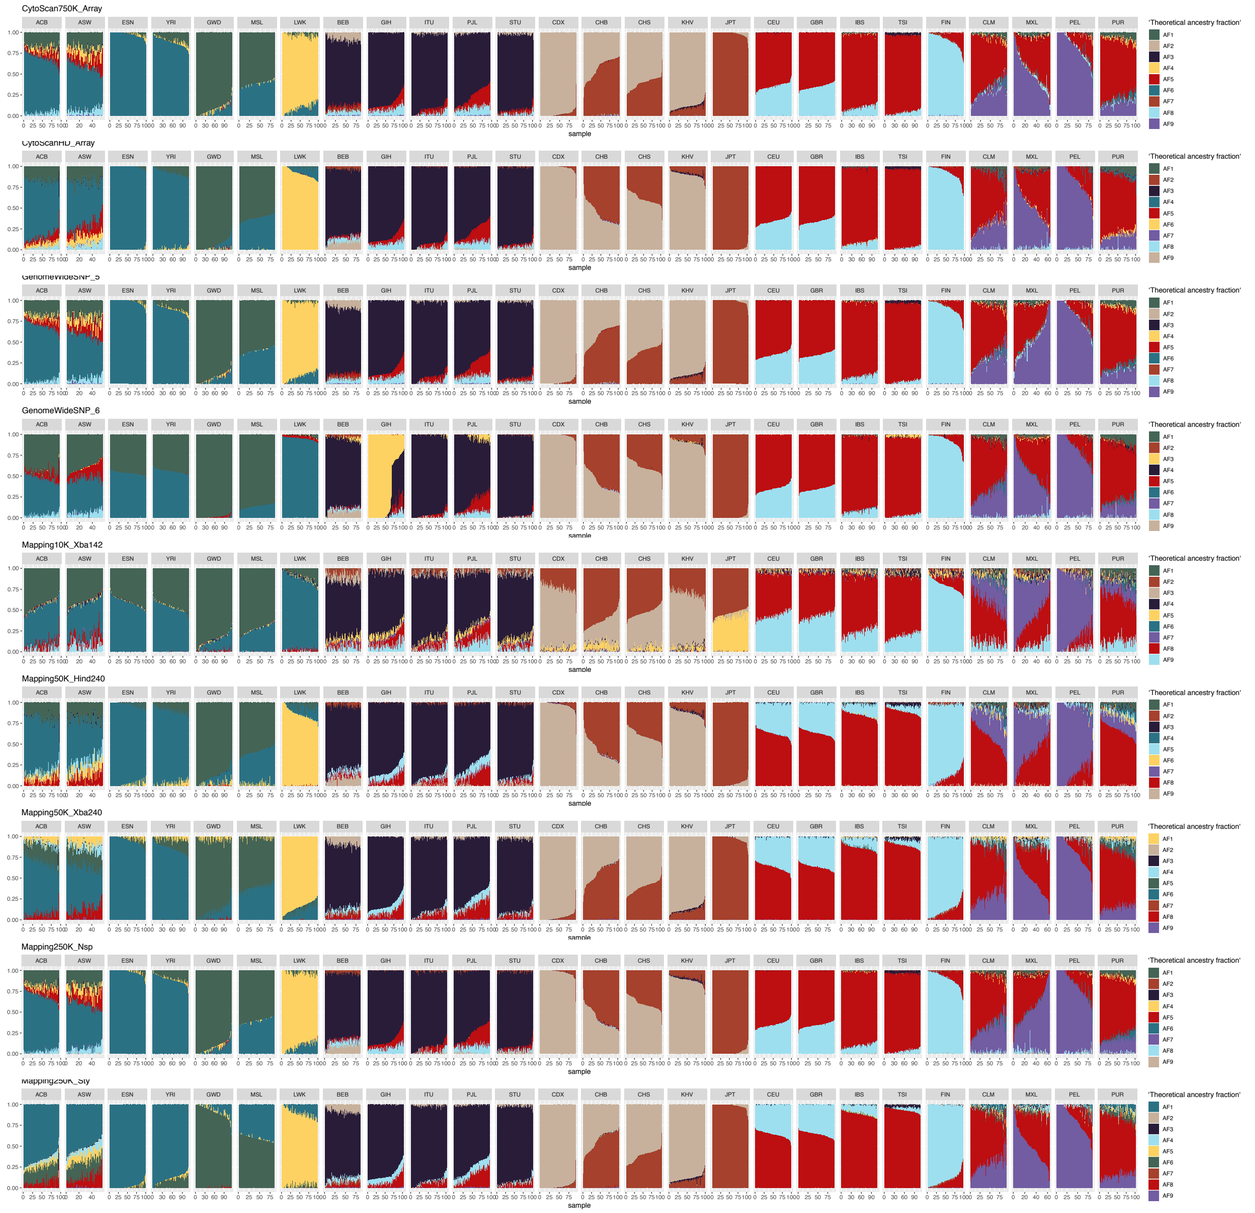

Figure S1 The fraction or contribution of theoretical ancestors (k=9) in reference individuals from 1000 Genomes Project with regard to nine SNP array platforms. The x-axis are individual samples, grouped by their respective population. Groups belonging to the same continent/superpopulation are placed neighboring to each other: AFR (1-7), SAS (8-12), EAS (13-17), EUR (18-22), AMR (23-26).

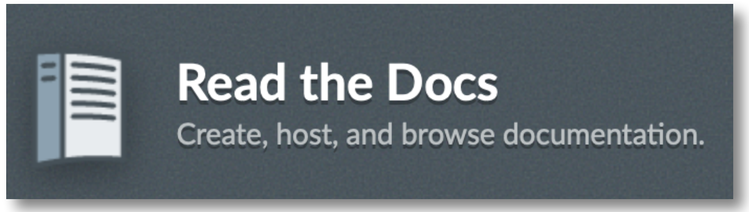
[1]Medizinische Klinik und Poliklinik V der Universität Heidelberg, Germany and [2]Department of Pathology, Stanford University Medical Center, Stanford, CA 94305, USA

Received on July 5, 2001; revised on July 9, 2001; accepted on July 16, 2001

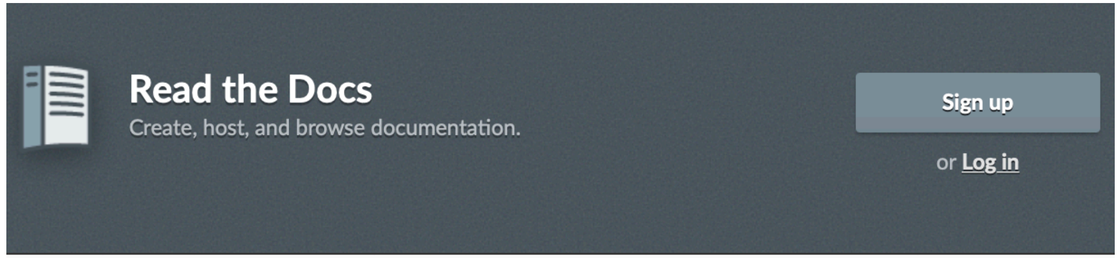
Documentation Strategies

Currently en Vogue

- Cloud-based documentation systems with online compilation
- written in simplified markup languages
  - ➡ Markdown (Yeah!)
  - ➡ Restructured Text (Meeh...)
- local and/or service based compilation and hosting
- build systems & output hosting
  - ➡ ReadTheDocs
    - direct building from .rst document tree or MkDocs based
  - ➡ Github Pages
    - direct using Jekyll or over MkDocs through GH actions



Documentation Strategies



Technical documentation lives here

Read the Docs simplifies software documentation by automating building, versioning, and hosting of your docs for you.

Free docs hosting for open source

We will host your documentation for free, forever. There are no tricks. We help over 100,000 open source projects share their docs, including a custom domain and theme.

Always up to date

Whenever you push code to your favorite version control service, whether that is GitHub, BitBucket, or GitLab, we will automatically build your docs so your code and documentation are never out of sync.

Downloadable formats

We build and host your docs for the web, but they are also viewable as PDFs, as single page HTML, and for eReaders. No additional configuration is required.

Multiple versions

We can host and build multiple versions of your docs so having a 1.0 version of your docs and a 2.0 version of your docs is as easy as having a separate branch or tag in your version control system.

Example: GA4GH Variation Representation Standard ->

classifications-and-ontologies.md
Classifications, Ontologies and Standards
The Progenetix resource utilizes standardized diagnostic coding systems, with a move towards hierarchical ontologies. As part of the coding process we have developed and provide several code mapping resources through repositories, the Progenetix website and APIs.
Additionally to diagnostic and other clinical concepts, Progenetix increasingly uses hierarchical terms and concepts for the annotation and querying of technical parameters such as platform technologies. Overall, the Progenetix resource uses a query syntax based around the [Beacon v2 "filters"](https://beacon-project.io/v2/filters.html) concept with a [CURIE](https://www.w3.org/TR/2010/NOTE-curie-20101216/) -based syntax
MkDocs & Material for MkDocs & Github Actions
Public Ontologies with CURIE-based syntax
CURIE prefix	Code/Ontology	Examples
NCIT	NCIt Neoplasm[^1]	NCIT:C27676
HP	HPO[^2]	HP:0012209
PMID	NCBI Pubmed ID	[PMID:18810378](http://progenetix.org/services/ids/PMID:18810378)
geo	NCBI Gene Expression Omnibus[^3]	[geo:GPL6801](http://progenetix.org/services/ids/geo:GPL6801), [geo:GSE19399](http://progenetix.org/services/ids/geo:GSE19399), [geo:GSM491153](http://progenetix.org/services/ids/geo:GSM491153)
arrayexpress	EBI ArrayExpress[^4]	arrayexpress:E-MEXP-1008
cellosaurus	Cellosaurus - a knowledge resource on cell lines [^5]	cellosaurus:CVCL_1650
UBERON	Uberon Anatomical Ontology[^6]	UBERON:0000992
cbioportal	cBioPortal[^9]	[cbioportal:msk_impact_2017](http://progenetix.org/services/ids/cbioportal:msk_impact_2017)
Private filters
Since some classifications cannot directly be referenced, and in accordance with the upcoming Beacon v2 concept of "private filters", Progenetix uses additionally a set of structured non-CURIE identifiers.

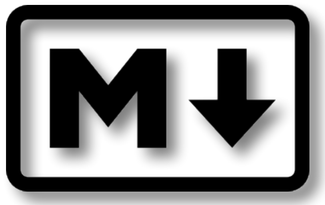
Documentation Strategies

Best Practices

- start early
- update often
- sometimes try to follow your own guide
- balance between inline documentation & doc system
- use Markdown
- plan for contingencies
  - ➡ cloud providers disappear | cancel services | change terms



https://en.wikipedia.org/wiki/List_of_defunct_social_networking_services

https://en.wikipedia.org/wiki/List_of_search_engines#Defunct_or_acquired_search_engines

Progenetix as Example Genomics Resource

Some trajectories ...

- from local database to **online resource**
- from flat database to **hierarchical object storage**
- from dedicated database to mix of **open software tools**
- from static pages to **data driven website**
- from copy, paste, clean to **automated download & process** - still edit & clean
- from registered access to raw data & commercial licensing to **CC BY 4.0** (CC0 for tools)
- from local software development to **open code on Github**
- from standalone resource to federated data, **APIs** and services

progenetix

(Bio)informatics Skill Set

What has been needed to develop & maintain progenetix.org?

- Scripting and application development using Python, Perl and JavaScript
- Data analysis and plotting in R, Python and Perl
- Regular expressions for data entry an (programmatic) identifier matching
- JSON, YAML, tab-delimited text as file formats; some binary source files (.CEL)
- non-SQL database (MongoDB) for flexibility and document structure
- web development with Perl, Python, JS, React and Apache server; Cloudflare
- No proprietary software involved (some OpenOffice Calc / Google Sheets spreadsheets for data cleanup)

Master Project in Data Wrangling? Ask!

BIO390: Course Schedule

- 2022-09-20: Michael Baudis - What is Bioinformatics? Introduction and Resources
- 2022-09-27: Christian von Mering - Sequence Bioinformatics
- 2022-10-04: Mark Robinson - Statistical Bioinformatics
- 2022-10-11: Valentina Boeva (ETHZ) - Machine Learning for Biological Use Cases
- 2022-10-18: Izaskun Mallona - Regulatory Genomics and Epigenomics
- 2022-10-25: Shinichi Sunagawa (ETHZ) - Metagenomics
- 2022-11-01: Katja Baerenfaller (SIAF) - Proteomics
- 2022-11-08: Pouria Dasmeh - Biological Networks
- 2022-11-15: Patrick Ruch - Text mining & Search Tools
- 2022-11-22: Ahmad Aghaebrahimian (ZHAW) - Semantic Web
- 2022-11-29: Michael Baudis - Building a Genomics Resource
- **2022-12-06: Valérie Barbie (SIB) - Clinical Bioinformatics**
- 2022-12-13: Michael Baudis - Genome Data & Privacy | Feedback
- 2022-12-20: Exam (Multiple Choice)

BIO390 HS22

Exam planning

- On site exam!
- 2022-12-20
- time: 08:15-09:45
- multiple (single + multiple) choice w/ one or two open questions
- no material, phones etc.
- student ID for entrance
