Overview

- Introduction and objectives
- Metrics
- Words
- Tasks
- Methodologies
- Text Categorization

Objectives

- Introduce how text mining can support bioinformatics tasks
- Explain how text mining operate with biological entities and the « biological » ecosystem
- Stimulate your interest into a satellite - yet very lifeful - bioscience field

- Text Mining is like Data Mining but works with textual contents
- ... So any statistical analysis can be performed with text mining provided the content is available in text ?
- Answer: **Jein !**

- Natural language processing, computational linguistics (+)
- Machine learning / data mining (++)
- **Information retrieval (+++)**

Common application fields

- Information retrieval
- Biocuration support tools → tools to maintain KB
- Biological modelling, e.g. biotic interactions

User level tasks

- Search – Foundations
- Triage (i.e., binary classification)
- Keyword assignment (i.e., multi-class classification)
- (Named-)Entity recognition
- Extract passages or more complex entities (e.g. protein protein interactions)

User level tasks

- Summarization
- Retrieval-augmented summarization/generation
- ChatBots

- Precision
- Recall
- Other metrics...

- Like most data mining tasks, information retrieval and text mining tasks are assessed using two dimensions metrics

Precision

- Given 5 relevant documents in a collection for a given query, a search engine returns **10** documents, including **3**, which are pertinent
- $P = 3/10 = 0.30$ or 30%

Recall

- Given **5** relevant documents in a collection for a given query, a search engine returns 10 documents, including **3**, which are pertinent
- $\text{Recall} = 3/5 = 0.60$ or 60%

Precision

- Given 8 relevant documents in a collection for a given query, a search engine returns 10 documents, including 8, which are pertinent
- Please compute the precision ?

Recall

- Given 8 relevant documents in a collection for a given query, a search engine returns 10 documents, including 8, which are pertinent
- Please compute the recall ?

Recall vs. Precision

- Precision is usually regarded as more important because redundancy is (usually) high in large collections...
- Exceptions are numerous
 - Looking for allergies of patients
 - Looking for rare variants
 - Looking for known items
 - [...]

Exemple

■ Rare variants

<https://variomes.text-analytics.ch/>

■ SynVar (expansion engine)

<https://goldorak.hesge.ch/synvar>

Variant P53 (R213L)

Synthetic metrics

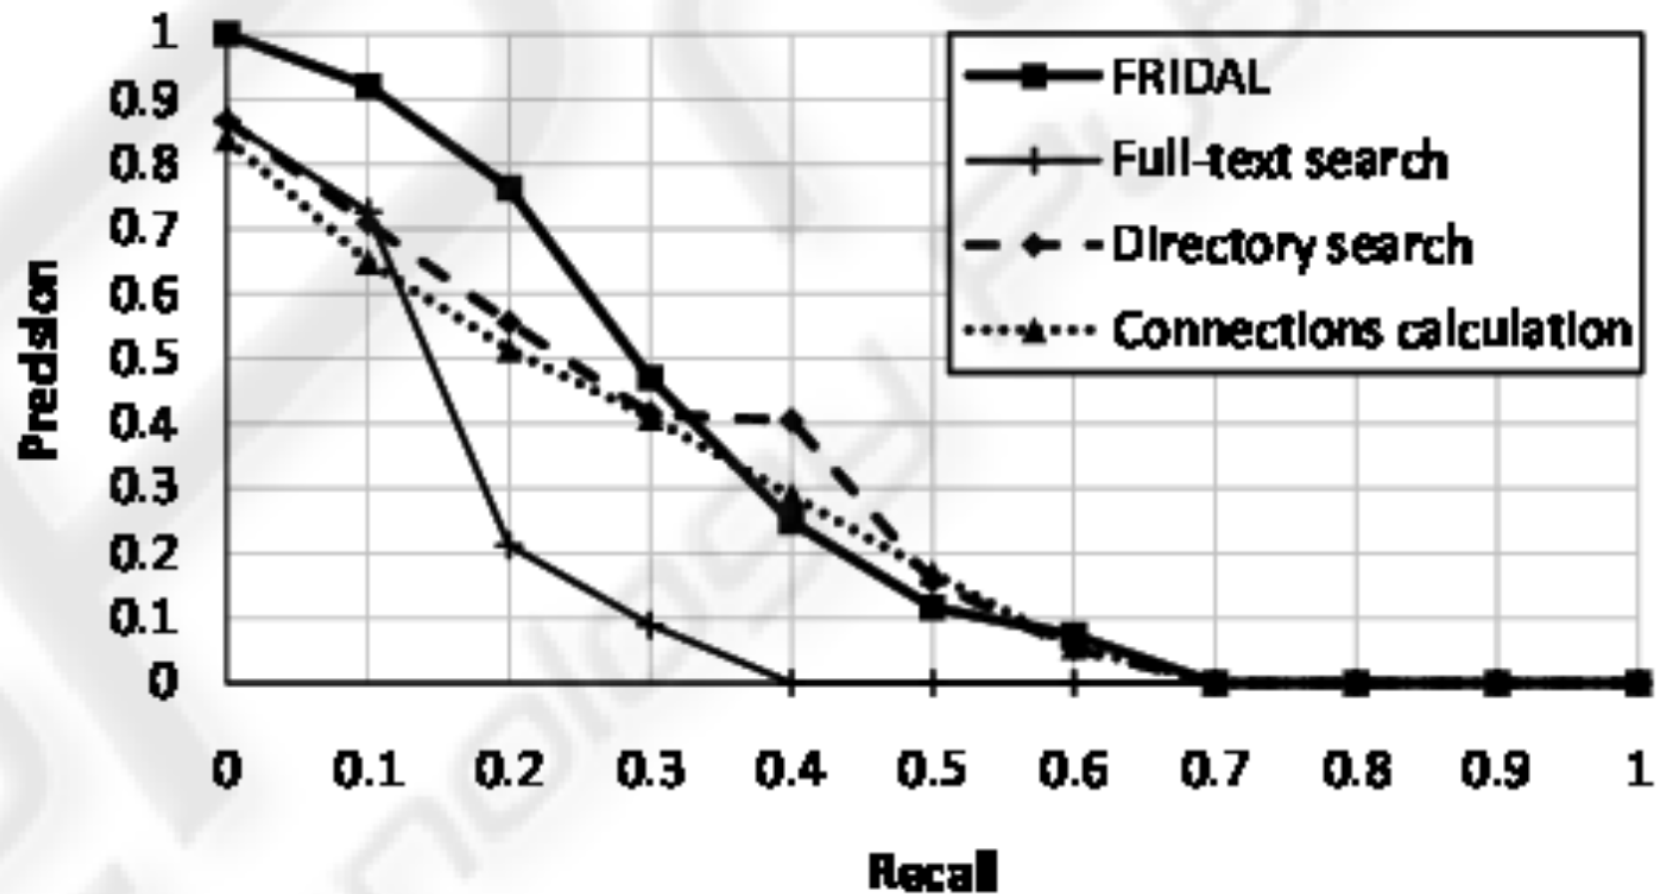

■ Rank

- R^{th-1} is more important than R^{th}
- So, we compute average precision at different rank values (10, 20, ... 30%, ...)
- Mean average precision

■ F1 and related metrics

- Harmonic or geometric mean
- Utility metrics
 - E.g., $0.9 \times \text{Recall} + 0.1 \times \text{Precision}$

Example

Feature normalization

- Words
- Subwords (character N-grams)
- Stems
- Word N-grams
- Syntactic entities (noun phrases, verb phrases, ...),
- Semantic entities (gene names, chem. compounds, diseases, ...)

Term normalization: database & ontology vs. reality !

 - SMILES
 - PubChem, chEBI, DrugBank...

Stemming vs. Lemmatization (needs syntactic analysis)

Original	Stemming	Lemmatization
New	New	New
York	York	York
is	is	be
the	the	the
most	most	most
densely	dens	densely
populated	popul	populated
city	citi	city
in	in	in
the	the	the
United	Unite	United
States	State	States

Impact of normalization and expansion ?

- Recall

- Precision

Normalization and expansion impact

■ Recall

Normalization/expansion improves recall

■ Precision

Normalization/expansion degrades precision

→ No free lunch and fine-tuning are needed !

Back end tasks – intelligent stuff that computers can do ☺

- Ranker

- Classifier

- ... and both are the same: a classifier is a ranker with a threshold !

- Regression (ok for structured data)

Ranking and text mining features

- Given an objective function, rank a collection of text !
- Objective function = distance, precision, recall, ...

Classification: one-class, binary, ...

- With n binary classifiers, we can design n -class categorizers

■ PubMed

- Boolean & Ante-chronological
- « Best match »
 - Vector-space
 - Learning to rank

■ EuropePMC

- Vector-space (Lucene)

■ SIBiLS

- Vector-space (Lucene)
- Combination of weighting schema (Terrier)

Boolean vs. Vector-space systems

- Boolean: would return results satisfying the query using AND, OR, NOT operators
- Vector-space is like Boolean but the ranking is based on the differential weighting of:
 - TF: Term frequency
The more frequent a term in a document the stronger the association with that document
 - IDF: Inverse document frequency
The less frequent a term in a document collection the stronger the association with a document it appears in
 - Document normalization factor
Longer documents tend to have more words irrespective on the relevance of those words

Weighting schema

Term frequency		Document frequency		Normalization	
n (natural)	$tf_{t,d}$	n (no)	1	n (none)	1
l (logarithm)	$1 + \log(tf_{t,d})$	t (idf)	$\log \frac{N}{df_t}$	c (cosine)	$\frac{1}{\sqrt{w_1^2 + w_2^2 + \dots + w_M^2}}$
a (augmented)	$0.5 + \frac{0.5 \times tf_{t,d}}{\max_t(tf_{t,d})}$	p (prob idf)	$\max\{0, \log \frac{N - df_t}{df_t}\}$	u (pivoted unique)	$1/u$ (Section 6.4.4)
b (boolean)	$\begin{cases} 1 & \text{if } tf_{t,d} > 0 \\ 0 & \text{otherwise} \end{cases}$			b (byte size)	$1/CharLength^\alpha, \alpha < 1$
L (log ave)	$\frac{1 + \log(tf_{t,d})}{1 + \log(\text{ave}_{t \in d}(tf_{t,d}))}$				

Machine learning for retrieval ? Yes, learning to rank

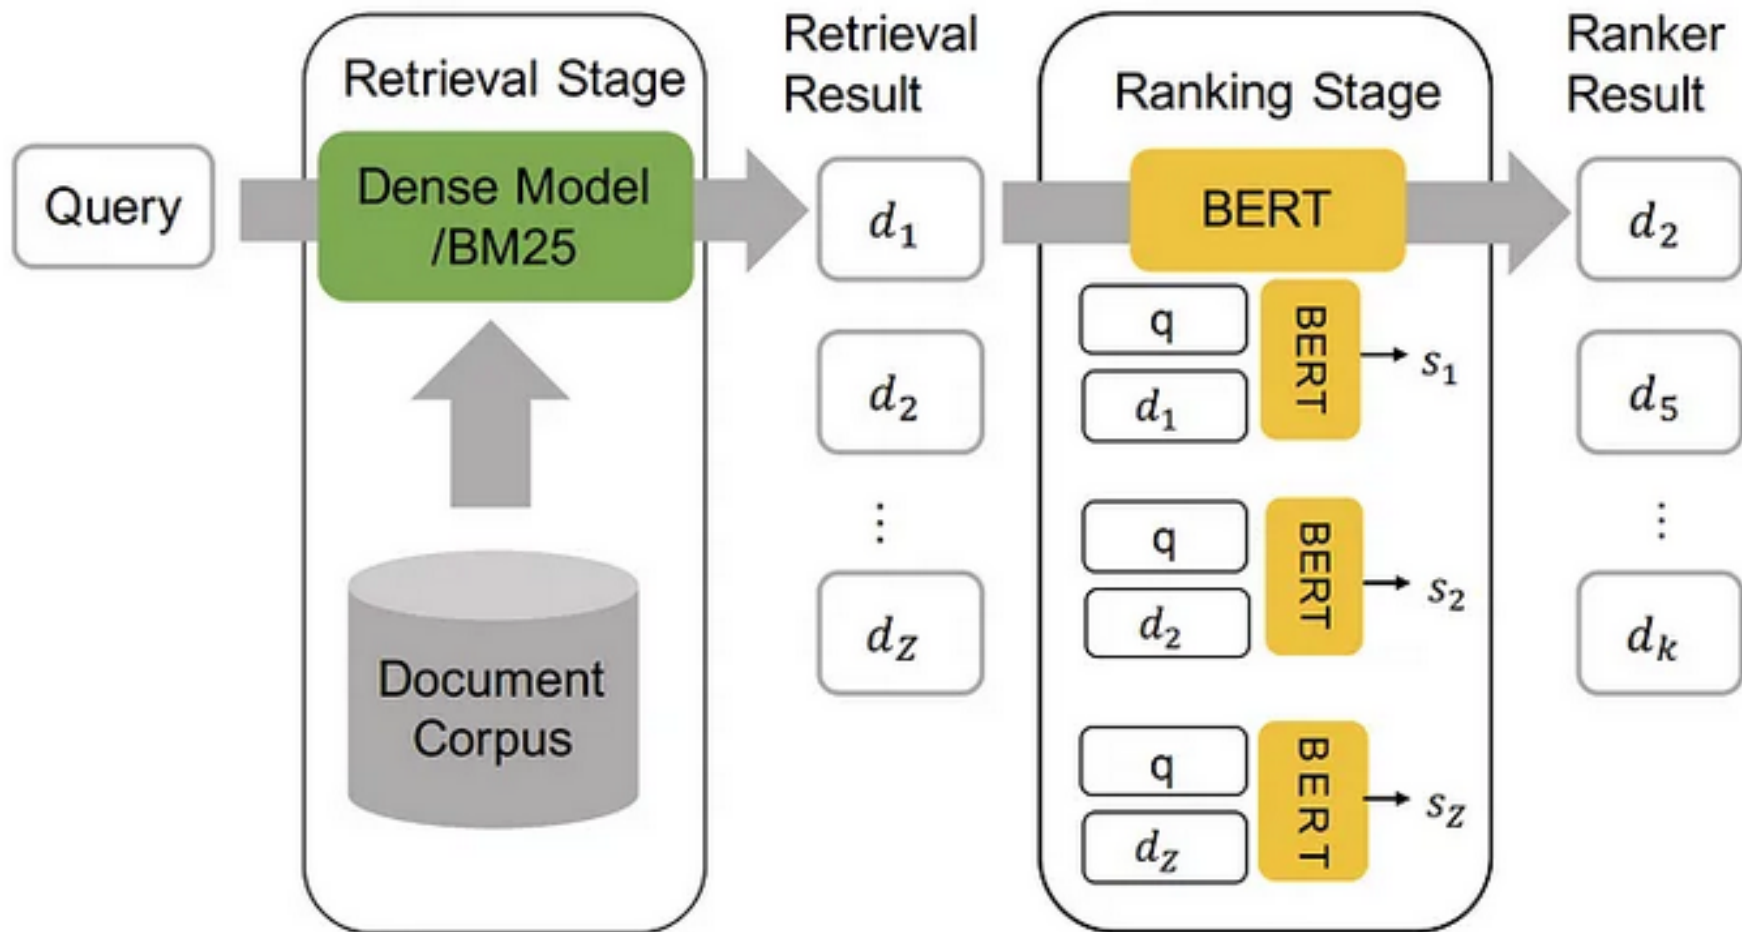

Zero-shot learning does not exist...

Language models did improved the ability to learn with little data

Typically in IR, you need 2-3 iterations or min. 20-30 queries to start learning something useful !

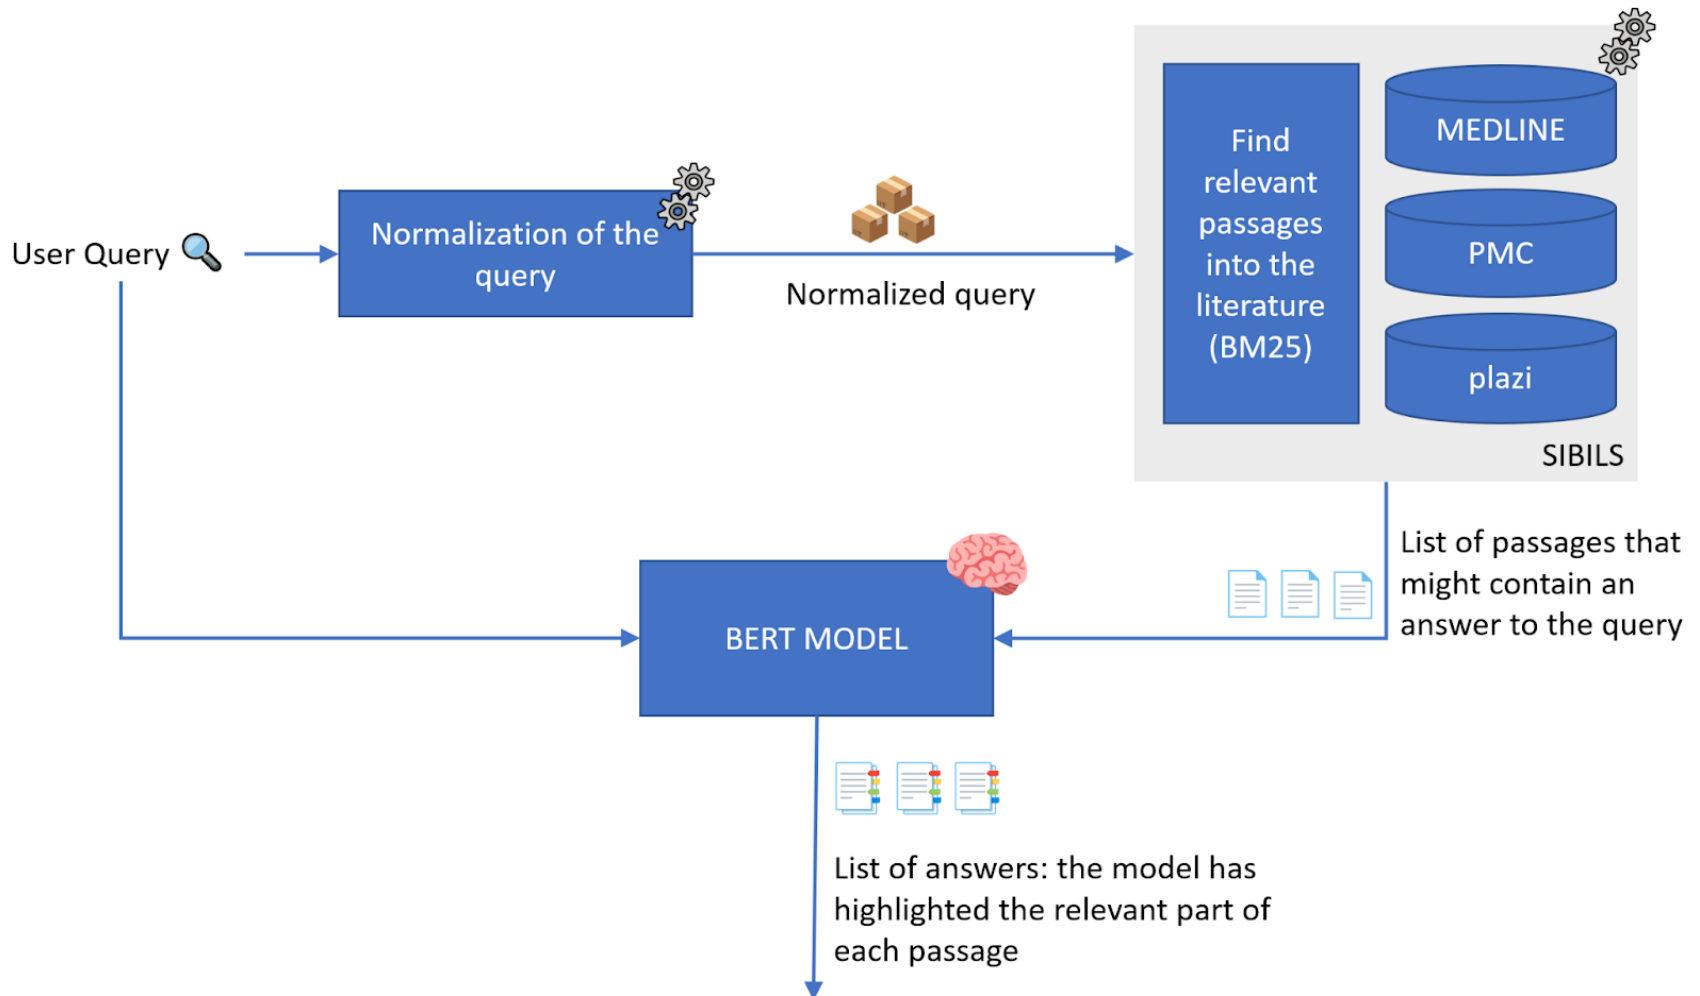

Search + pre-trained language models such as BERT

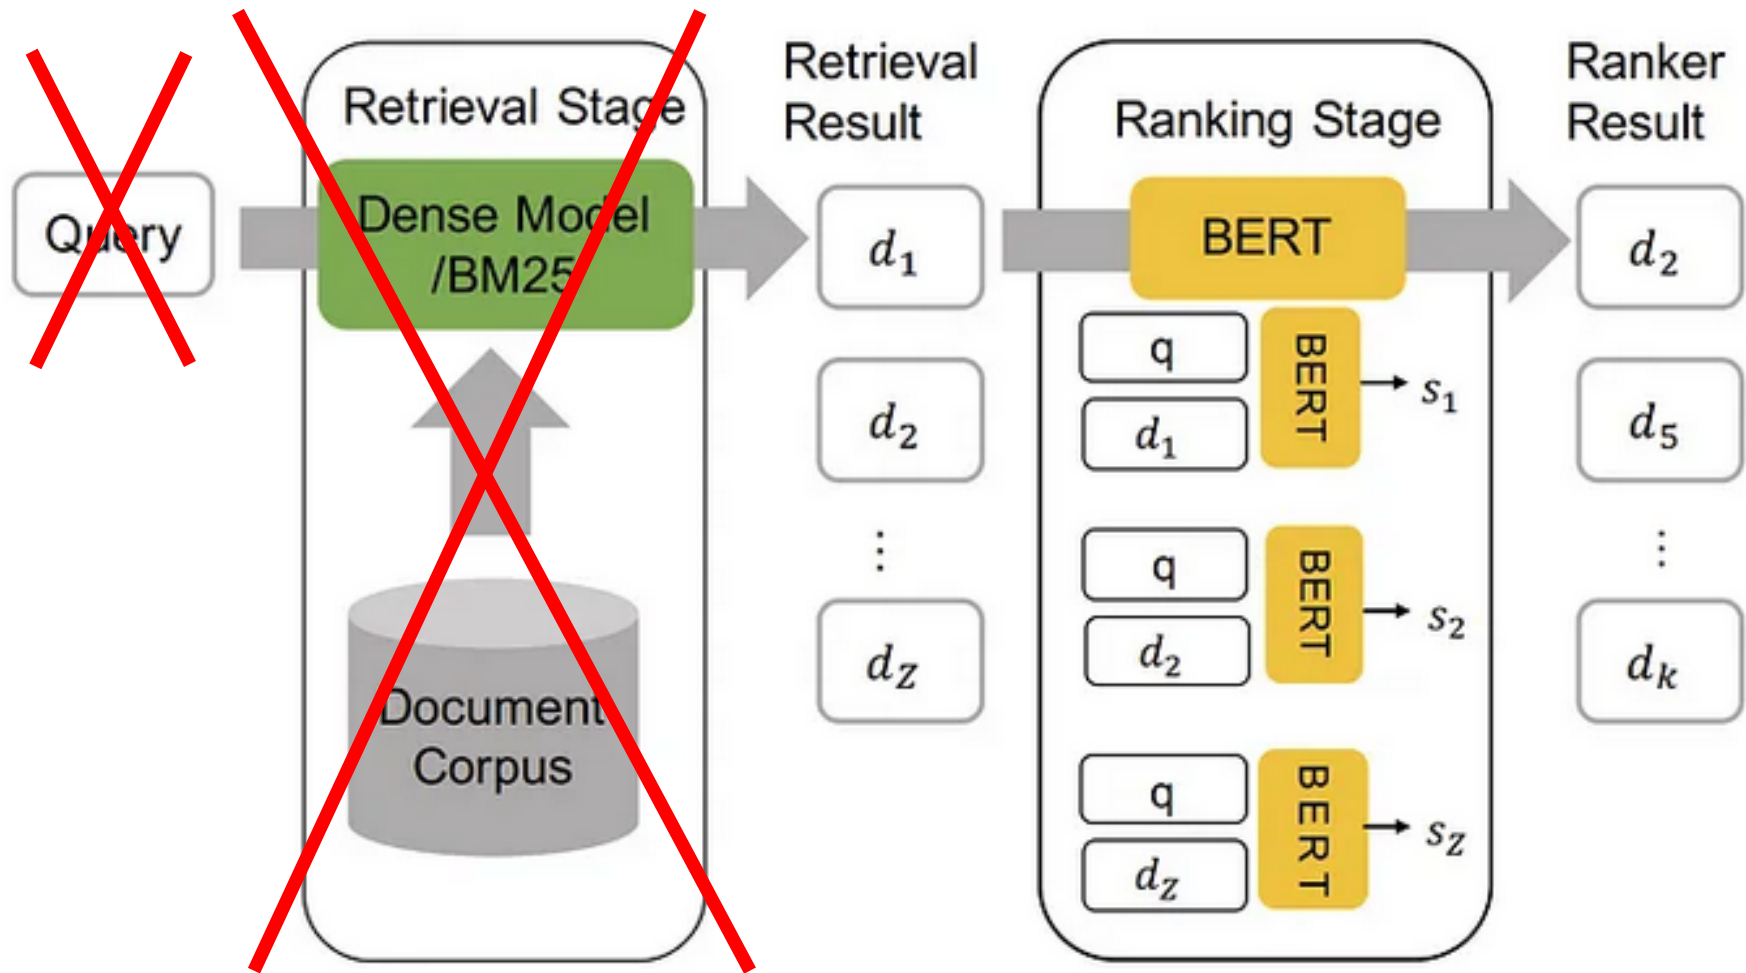

Sparse retrievers → Large matrix, mostly sparse
Dense retrievers → Embeddings

Question Answering

■ <https://sibils.text-analytics.ch/search/>

Zero search cases also can occur...

Sparse retrievers → Large matrix, mostly sparse
Dense retrievers → Embeddings

CellTriage: query independent model-based curation support
