Building a Genomics Resource Progenetix - From Experiments to APIs

Michael Baudis | UZH BIO390 HS23

Building a Genomics Resource A (personal) journey through time...

- Genomic Copy Number Variations in cancer (CNA / CNV)
- Comparative Genomic Hybridization (CGH) as the original CNV screening technique
- CNVs differ between cancer (sub)types and may correlate to clinical outcome
- single studies are limited in understanding disease-specific changes let's build a database
- databases should be accessible let's move online
- more data data parsers & text mining
- visualization graphics libraries and data formatting
- large datasets access through APIs

Genome screening at the core of "Personalised Health"

Department of Molecular Life Sciences

- **Genome analyses** (including transcriptome, metagenomics) are core technologies for Personalised Health[™] applications
- The unexpectedly large amount of sequence variants in human genomes - germline and somatic/cancer - requires huge analysis efforts and creation of **reference repositories**
- Standardized data formats and exchange **protocols** are needed to connect these resources throughout the world, for reciprocal, international data sharing and biocuration efforts
- Our work @ UZH:
 - cancer genome repositories
 - biocuration
 - protocols & formats

Global Alliance for Genomics & Health

Cancers are based on acquired and inherited genomic mutations

Knudson, A. G. (2001). Two genetic hits (more or less) to cancer. Nature Reviews Cancer, 1(2), 157–162.

Theodor Boveri (1914) Observations in sea urchin eggs

- **Cell-cycle checkpoints** ("Hemmungseinrichtung")
- Tumour-suppressor genes ("Teilungshemmende Chromosomen"), which may be overcome by external signals, and can be eliminated during tumour progression
- Oncogenes ("Teilungsfoerdernde Chromosomen") that become amplified ("im permanenten Übergewicht")
- **Progression** (benign to malignant), w/ sequential changes of chromosomes
- Clonal origin & Genetic mosaicism
- Cancer **predisposition** through inheritance of "chromosomes" that are less able to suppress malignancy
- Inheritance of the same 'weak chromosome' from both parents leads to **homozygosity** and, consequently, to high-penetrance cancer syndromes - (e.g. xeroderma pigmentosum)
- Wounding and inflammation in tumour promotion; loss of cell adhesion in metastasis; sensitivity of malignant cells to radiation therapy (based on Hertwig *et al.*)

Figure 2 | Multiple cell poles cause unequal segregation of chromosomes. a | Boveri showed that fertilization of sea-urchin eggs by two sperm results in multiple cell poles. Individual chromosomes then attach to different combinations of poles - for example, one copy of chromosome c is attached to poles 1 and 2, and one copy is attached to poles 2 and 3. **b** Chromosomes are segregated to the four poles at cell division, leaving some cells with too many copies of the chromosomes and some with too few — for example, cell 2 has two copies of chromosome c and cell 4 has none.

progenetix.net: storage and visualization of genomic aberration data in human malignancies michael baudis, md

Over the last decade, techniques for the genome wide scanning for genomic imbalances in malignant neoplasia have been developed, e.g. Comparative Genomic Hybridization (CGH).

Currently, no comprehensive online source for CGH data with a standardized format suitable for data mining procedures has been made available for public access. Such a data repository could be valuable in identifying genetic aberration patterns with linkage to specific disease entities, and provide additional information for validating data from large scale expression array experiments.

A case and band specific aberration matrix was selected as most suitable format for the mining of CGH data. The [progenetix.net] data repository was developed to provide the according data to the research community for a growing number of human malignancies.

In the current implementation, two main purposes are being served. First, access to the band specific pattern of chromosomal imbalances allows the instantaneous identification of genomic "hotspots". Second, the band specific aberration matrices can be included in data mining efforts. As an example, the clustering off all informative cases from the current (September 2001) dataset is shown here (online source under www.progenetix.net/bcats/clustered.png).

Data selection

PubMed is searched for publications applying CGH to the analysis of malignant tumors. Articles are selected according to their online availability and the description of genomic imbalances on a per case basis.

Transformation of input data

Chromosomal aberration data is transformed via customized parsing commands to a common format adherent to ISCN 1995 recommendations. In some cases, aberration data was transcribed from graphical representations or provided by the authors.

Data storage

Currently, the primary data is stored in a dedicated "off-line" database. Besides case identifier and ISCN adapted chromosomal imbalance data, tumor classification and source information including the PubMed identifier is recorded. Disease entities are reclassified to ICD-O-3 codes.

Text parsing and generation of aberration matrix

For the generation of the case and band specific aberration matrix, a dedicated text pattern comparison model was developed using Perl. Briefly, for each chromosomal band, the aberration field of each case is searched for a variety of patterns containing aberration information applying to that band. A matrix with currently 324 band resolution is generated, annotating chromosomal gains with "1" and losses with "-1"; localized highlevel gains are designated "2".

Website generation

For graphical representation of chromosomal imbalances, HTML pages containing different views of the underlying aberration matrices are generated using Perl. Graphics are implemented using HTML syntax. Besides band specific, whole genomic overviews, chromosome specific pages with links to all involved cases are generated for each ICD-O-3 entity as well as for each registered project. Additionally, those representations are available for several subsets combining related data (e.g. all lymphoid neoplasias, breast carcinoma cases). For each of the groups, the according aberration matrix is linked for download.

Hierarchical clustering of band specific chromosomal imbalances from 999 human neoplasias, contained in the [progenetix.net] collection. Cases without aberrations were

ABSTRACT

Summary: Through sequencing projects and, more recently, array-based expression analysis experiments, a wealth of genetic data has become accessible via online resources. In contrast, few of the (molecular-) cytogenetic aberration data collected in the last decades are available in a format suitable for data mining procedures. www.progenetix.net is a new online repository for previously published chromosomal aberration data, allowing the addition of band-specific information about chromosomal imbalances to oncologic data analysis efforts.

Availability: http://www.progenetix.net Contact: mbaudis@stanford.edu

Neoplastic transformation and progression is the result of genetic defects arising in normal cells and giving rise to a malignant clone. During the process of oncogenesis, some of the usually multiple steps required for acquisition of the full neoplastic phenotype may represent themselves as numerical or structural abnormalities in the chromosomes of the transformed cells.

Over the last decades, the analysis of chromosomal abnormalities in malignant cells has gained importance in oncologic research as well as in clinical practice. A vast number of genetic abnormalities has been identified in the virtually complete range of human neoplasias. Several attempts have been undertaken for collection and classification of those abnormalities, the most widely recognized being the catalog by Mitelman and co-workers (Mitelman, 1994; online access through http://cgap.nci. nih.gov/Chromosomes/Mitelman).

In addition to metaphase analysis of short-term cultivated tumor cells or tumor cell lines, molecular cytogenetic techniques have recently been applied to the analysis of chromosomal abnormalities in primary tumor tissues. One of the more widely used screening techniques is Comparative Genomic Hybridization (CGH; Kallioniemi et al., 1992; du Manoir et al., 1993). Briefly, this method is based on the competitive *in-situ* hybridization of differentially labeled tumor versus normal genomic DNA to normal human metaphase spreads. The calculation of the intensity ratios of the two fluorochromes gives an overview about relative gains and losses of DNA in the tumor genome with mapping to the respective chromosomal bands. The identification of frequently imbalanced regions in tumor entities may point towards tumor suppressor gene or proto-oncogenes mapping to the respective chromosomal bands. Usually, the result of those experiments is communicated either in text format according to the International System for Cytogenetic Nomenclature (Mitelman, 1995) or graphically, with aberration bars next to chromosomal ideograms for the representation of chromosomal gains and losses.

Because in each experiment CGH analysis covers the whole number of chromosomes, the comparision of data sets from related malignancies could lead to the delineation of common as well as divergent genetic pathways defining the respective malignant phenotypes. Although an extremely large number of malignant tumors has been analyzed using this technique, no comprehensive CGH database with band-specific chromosomal aberration information is publicly available[†].

A minimal requirement for such a database would be the conversion of the text or graphical information used in publications to data tables, representing the information about the aberration status of single chromosomal bands for each case. For the site discussed here, this process includes: (1) the transformation of the published results in a format adapted from the ISCN, and (2) the automatic generation of the band specific aberration table.

Due to format variations of the published data, step 1 consists of the manual conversion of the text data or evaluation and conversion of the graphical representations, respectively. Due to the (in computational terms) odd

^aAJCC/UICC staging system (Hutter and Sobin, 1986).

^bG rade of primary tumor: 1–3, low, moderate, high grade; 9, grading unknown.

^cSynchronous, diagnosis of metastatic disease within 12 months following diagnosis of primary tumor; metachronous, diagnosis of metastatic disease after 12 months or later.

Disease annotations in Progenetix From some text, somewhere, to ontology classes

- diagnostic categories are the most important labels to associate with genomic observations
- original data almost *never* uses modern, hierarchical classification systems but provides circumstantial ("breast cancer in pre-menopausal...") or domain-specific ("CLL Binet B", "colorectal carcinoma Dukes C") information
- clinical classifications (ICD-10 ...) have very limited relation to tumor biology
- concepts change over time ...
- for cancer, the "International Classification of Diseases in Oncology" (ICD-O 3) by IARC / WHO traditionally has been a good compromise to map to - but with non-hierarchical structure and is used by international reference projects

From Classification to Hierarchical Ontology: ICD-O -> NCIt

- (morphology ~ histology/biology + topography ~ organ/tissue)

• since its beginning Progenetix samples have been classified using the 2 arms of the ICD-O system

over the last years we have established mappings between ICD-O code pairs and the NCIt "neoplasm" part of the NCI metathesaurus, thereby empowering hierarchical data structures for search and analysis

DX Ontologies Hierarchical NCIt Neoplasm Core replaces heterogeneous primary annotations

- heterogeneous and inconsistent diagnostic annotations are common in clinical reports and research studies ("text", ICD-10, ICD-03, OncoTree, domain-specific classifications)
- highly variable granularity of annotations is a major road block for comparative analyses and large scale data integration
 - "Colorectal Cancer" or "Rectal Mucinous Adenoca."
- initiatives and services such as Phenopackets, MONDO, OXO ... rely on and/or provide mappings to hierarchical ontologies

NCIt Neoplasm Core coded display (excerpt) for samples in the Progenetix cancer genome data resource allows sample selection on multiple hierarchy levels \rightarrow

Standardized Data

Data re-use depends on standardized, machine-readable metadata

- Multiple international initiatives (ELIXIR, GA4GH, MONARCH...) and resource providers (EBI, NCBI ...) work on the generation and implementation of data annotation standards
- emerging / established principles are the use of hierarchical coding systems where individual codes are represented as CURIES
- other formats for non-categorical annotations based on international standards, e.g.
 - ► ISO (ISO 8601 time & period, ISO 3166 country codes ...)
 - ► IETF (GeoJSON ...)
 - ► W3C (CURIE ...)
- these standards become pervasive throughout GA4GH's ecosystem (e.g. Phenopackets ...)

Data Curation

Provide "clean and correct data" - but final verification of data from external resources lies with the user ...

- correct data is important for any type of scientific analysis
- errors in formats and values can occur during all steps between data acquisition and analysis (numerous "Excelgates"!)
- "meta"-resources and analyses are prone to erroneous data due to varying input formats and lack of source control
 - always look for batch effects and outliers!

distribution (by corresponding author) of the **118554** genomic array, **36766** chromosomal CGH and **42105** v

Data Curation - Geolocations Provide "clean and correct data" - but final verification of data from external resources lies with the user ...

The most geo-tagged place on earth is Null Island

A troubleshooting country has been added with an Indeterminate sovereignty class called Null Island (1, 2). It is a fictional, 1 meter square island located off Africa where the equator and prime meridian cross. Being centered at 0,0 (zero latitude, zero longitude) it is useful for flagging geocode failures which are routed to 0,0 by most mapping services. Aside: "Null Islands" exist for all local coordinate reference systems besides WGS84 like State Plane (and global if not using modern Greenwich prime meridian). Null Island in Natural Earth is scaleRank 100, indicating it should never be shown in mapping. Side note: Rank 30 (zoom 29 in Google speak)

https://en.wikipedia.org/wiki/Null Island

Database Structure From flat database to hierarchical object storage

- collections in Progenetix MongoDB database reflect a consensus domain model for genomic data repositories
- flexible linking and object structure facilitates rapid change-overs
- BSON/JSON format in DB
 - equals data in JavaScript
 - equals objects in Python, Perl

rapid prototyping and implementation

- non-SQL document database (MongoDB)
- different object domains connected through identifiers
- data-driven website with JavaScript based frontend and data population through API calls

Cancer genome data @ progenetix.org

The Progenetix database provides an overview of mutation data in cancer, with a focus on copy number abnormalities (CNV / CNA), for all types of human malignancies. The data is based on *individual sample data* from currently **142063** samples.

Floor of the Mouth Neoplasm (NCIT:C4401)

Download SVG | Go to NCIT:C4401 | Download CNV Frequencies

Example for aggregated CNV data in 126 samples in Floor of the Mouth Neoplasm. Here the frequency of regional copy number gains and losses are displayed for all 22 autosomes.

Progenetix Use Cases

Local CNV Frequencies \mathscr{O}

A typical use case on Progenetix is the search for local copy number aberrations - e.g. involving a gene - and the exploration of cancer types with these CNVs. The [Search

Page] provides example use cases for designing queries. Results contain basic statistics as well as visualization and download options.

Cancer CNV Profiles *I*

The progenetix resource contains data of **834** different cancer types (NCIt neoplasm classification), mapped to a variety of biological and technical categories. Frequency profiles of regional genomic gains and losses for all categories (diagnostic entity, publication, cohort ...) can be accessed through the [Cancer Types] page with direct visualization and options for sample retrieval and plotting options.

Cancer Genomics Publications

Through the [Publications] page Progenetix provides 4164 annotated references to research articles from cancer genome screening experiments (WGS, WES, aCGH, cCGH). The numbers of analyzed samples and possible availability in the Progenetix sample collection are indicated.

TCGA CNV Data

Search Genomic CNV Data from TCGA

This search page accesses the TCGA subset of the Progenetix collection, based on 22142 samples (tumor and reeferences) from The Cancer Genome Atlas project. The results are based upon data generated by the TCGA Research Network Disease-specific subsets of TCGA data (aka. projects) can be accessed below.

Progenetix Info

About Progenetix

Progenetix Publication Collection

The current page lists articles describing whole genome screening (WGS, WES, aCGH, cCGH) experiments in cancer, registered in the Progenetix publication collection. For each publication the table indicates the numbers of samples analysed with a given technology and if sample profiles are available in Progenetix.

Please contact us to alert us about additional articles you are aware of. The inclusion criteria are described in the documentation \mathscr{O} .

New Oct 2021 You can now directly submit suggestions for matching publications to the oncopubs repository on Github \mathscr{O} .

Progenetix Info

About Progenetix Use Cases Documentation Baudisgroup @ UZH

Services: Ontologymaps (NCIt)

The **ontologymaps** service provides equivalency mapping between ICD-O and other classification systems, notably NCIt and UBERON. It makes use of the sample-level mappings for NCIT and ICD-O 3 codes developed for the individual samples in the Progenetix collection.

NCIT and ICD-O 3

While NCIT treats diseases as **histologic** and **topographic** described entities (e.g. NCIT:C7700: **Ovarian adenocarcinoma**), these two components are represented separately in ICD-O, through the Morphology and Topography coding arms (e.g. here 8140/3 + C56.9).

More documentation with focus on the API functionality can be found on the documentation pages.

The data of all mappings can be retrieved trough this API call: {JSON7}

Code Selection ①

NCIT:C4004: Gastric Adenocarcinoma

Optional: Limit with second selection

Abstract

In cancer, copy number aberrations (CNAs) represent a type of nearly ubiquitous and frequently extensive structural genome variations. To disentangle the molecular mechanisms underlying tumorigenesis as well as identify and characterize molecular subtypes, the comparative and meta-analysis of large genomic variant collections can be of immense importance. Over the last decades, cancer genomic profiling projects have resulted in a large amount of somatic genome variation profiles, however segregated in a multitude of individual studies and datasets. The Progenetix project, initiated in 2001, curates individual cancer CNA profiles and associated metadata from published oncogenomic studies and data repositories with the aim to empower integrative analyses spanning all different cancer biologies. During the last few years, the fields of genomics and cancer research have seen significant advancement in terms of molecular genetics technology, disease concepts, data standard harmonization as well as data availability, in an increasingly structured and systematic manner. For the Progenetix resource, continuous data integration, curation and maintenance have resulted in the most comprehensive representation of cancer genome CNA profiling data with 138 663 (including 115 357 tumor) copy number variation (CNV) profiles. In this article, we report a 4.5-fold increase in sample number since 2013, improvements in data quality, ontology representation with a CNV landscape summary over 51 distinctive National Cancer Institute Thesaurus cancer terms as well as updates in database schemas, and data access including new web front-end and programmatic data access.

> Figure 3. Beacon-style guery using fuzzy ranges to identify biosamples with variants matching the CNA range This example gueries for a continuous, focal duplication covering the complete MYC gene's coding region with < = 6 Mb in size. A: Filter for dataset; B: filter for cancer classification (NCIt and ICD-O-3 ontology terms available); C: additional filter, e.g. Cellosaurus; D: additional filter for geographic location; E: external link to UCSC browser to view the alignment of matched variants; F: cancer type classification sorted by frequency of the matched biosamples present in the subset; G: list of matched biosamples with description, statistics and reference. More detailed biosample information can be viewed through 'id' link to the sample detail page; H: matched variants with reference to biosamples can be downloaded in json or csv format.

Data Use Cases

Genome CNV coverage in Cancer Classes

- 43654 out of 93640 CNV profiles; filtered for entities w/
 >200 samples (removed some entities w/ high CNV rate, e.g. sarcoma subtypes)
- Single-sample CNV profiles were assessed for the fraction of the genome showing CNVs (relative gains, losses)
- range of medians 0.001 (CML) 0.358 (malignant melanomas)

Chronic.

Lowest / Highest CNV fractions =>

Chronic Myelogenous Leukemia BCR-ABL1 Pos. (165)

Melanoma (835)

Bo Gao^{1,2} and Michael Baudis^{1,2*}

FIGURE 1 | The workflow of the study was composed of three parts. The *Features* part consisted of methods of data integration and feature generation. The Signature part focused on creating CNA signatures for cancer subtypes and the categorization of subtypes. The Classification part recruited machine learning techniques to predict the organ and the subtype from a given copy number profile.

Map of the geographic distribution (by first author affiliation) of the 104'543 genomic array, 36'766 chromosomal CGH and 15'409 whole genome/exome based cancer genome datasets.

The numbers are derived from the 3'240 publications registered in the Progenetix database.

Progenetix Publication Collection

The current page lists articles describing whole genome screening (WGS, WES, aCGH, cCGH) experiments in cancer, registered in the Progenetix publication collection. For each publication the table indicates the numbers of samples analysed with a given technology and if sample profiles are available in Progenetix.

Please contact us to alert us about additional articles you are aware of. The inclusion criteria are described in the documentation \mathscr{O} .

Population stratification in cancer samples based on SNP array data

- Despite extensive somatic mutations of cancer profiling data, consistency between germline and cancer samples reached 97% and 92% for 5 and 26 populations
- Comparison of our benchmarked results with self-reported meta-data estimated a matching rate between 88 % to 92%.
- Ethnicity labels indicated in meta-data are vague compared to the standardized output from our tool

Figure S1 The fraction or contribution of theoretical ancestors (k=9) in reference individuals from 1000 Genomes Project with regard to nine SNP array platforms. The x-axis are individual samples, grouped by their respective population. Groups belonging to the same continent/superpopulation are placed neighboring to each other: AFR (1-7), SAS (8-12), EAS (13-17), EUR (18-22), AMR (23-26).

Implementation driven development of a GA4GH standard

Progenetix and GA4GH Beacon

GENOMICS

A federated ecosystem for sharing genomic, clinical data

Silos of genome data collection are being transformed into seamlessly connected, independent systems

The Global Alliance for Genomics and Health* **SCIENCE** 10 JUNE 2016 • VOL 352 ISSUE 6291

A federated data ecosystem. To share genomic data globally, this approach furthers medical research without requiring compatible data sets or compromising patient identity.

A **Beacon** answers a query for a specific genome variant against individual or aggregate genome collections YES NO \0

Global Alliance "Beacon" - Jim Ostell, NCBI, March 7, 2014

Introduction

... I proposed a challenge application for all those wishing to seriously engage in *international* data sharing for human genomics....

- 1. Provide a public web service
- 2. Which accepts a query of the form "Do you have any genomes with an "A" at position 100,735 on chromosome 3?"
- 3. And responds with one of "Yes" or "No" ...

"Beacon" because ... people have been scanning the universe of human research for signs of willing participants in far reaching data sharing, but ... it has remained a dark and quiet place. The hope of this challenge is to 1) trigger the issues blocking groups ... in way that isn't masked by the ... complexities of the science, fully functional interfaces, and real issues of privacy, and to 2) in short order ... see real beacons of measurable signal ... from at least some sites ... Once your "GABeacon" is shining, you can start to take the next steps to add functionality to it, and finding the other groups ... following their GABeacons.

Utility

Some have argued that this simple example is not "useful" so nobody would build it. Of course it is not the first priority for this application to be scientifically useful. ...intended to provide a low bar for the first step of real ... engagement. ... there is some utility in ...locating a rare allele in your data, ... not zero. A number of more useful first versions have been suggested.

- 1. Provide *frequencies of all alleles* at that point
- 2. Ask for all alleles seen in a gene *region* (and more elaborate versions of this)
- 3. Other more complicated queries

Implementation

- 1. Specifying the chromosome ... The interface needs to specify the *accession.version* of a chromosome, or *build number*...
- 2. Return values ... right to refuse to answer without it being an error ... DOS attack ... or because ... especially sensitive...
- 3. Real time response ... Some sites suggest that it would be necessary to have a "phone home" response ...

"I would personally recommend all those be held for version 2, when the beacon becomes a service." Jim Ostell, 2014

GA4GH implementations Driving 2016 Beacor

Beacon(+) "Metadata"

Beacon+ by Progenetix

From Beacon Query to Explorative Analyses of CNV Patterns

- Since 2016 the Progenetix resource has been used to model options for Beacon development
 - 138334 individual samples from 698 cancer types
- The consistent use of hierarchical diagnostic codes allows the use of Beacon "filters" for histopathological/clinically scoped queries
- Beacon's handover protocols can be utilized for data retrieval and, well, handing over to additional services, e.g.
 - downloads
 - visualization
 - use of external services (UCSC browser display...)

Beacon v2: Extended Variant Queries Range and Bracket queries enable positional wildcards and fuzziness

- Genome Range Queries provide a way to "fish" for variants overlapping an indicated region, e.g. the CDR of a gene of interest
- Additional parameters (e.g. variant type, regerence or alternate bases) limit the scope of the responses
- new Beacon v2 size parameters to limit structural variants (e.g. "focal" CNVs)

DEL (Copy Number Loss) DUP (Copy Number Gain)

- Genome Bracket Queries allow to search for structural variants with start and end positions falling into defined sequence ranges
- allows to query any contiguous genomic variant (and in principle also can step in for range queries)
- typical use case is e.g the query for variants such as duplications covering the whole CDR of a gene, while limiting the allowed start or end regions

Beacon v2 Filters

Example: Use of hierarchical classification systems (here NCIt neoplasm core)

- Beacon v2 "filters" assumes inclusion of child terms when using hierarchical classifications
 - Implicit OR with otherwise assumed AND
- implementation of hierarchical annotations overcomes some limitatiions of "fuzzy" disease annotations

Beacon+ specific: Multiple term selection with OR logic

Beacon v2 Requests POSTing Queries

- Beacon v2 supports a mix of dedicated endpoints with REST paths
- POST requests using JSON query documents
- final syntax for core parameters still in testing stages

```

Edit Query

Assembly: GRCh38 C

Progenetix Genomic resource utilizing Beacon v2 calls

- Progenetix uses Beacon v2 queries to drive its UI
- all individuals, biosamples, variants, analyses matched by a given query are stored by their object ids
- handovers for variant purposes (e.g. to retrieve all matched variants) are returned in the original response and asynchronously retrieved by the front end app

Beacon v2 Paths

Progenetix utilizes Beacon v2 REST paths

- Beacon v2 paths are used in the Beacon specification to scope query and delivery
- Progenetix uses a default /biosamples/ + query path for its front end queries, and then collection specific methods for data retrieval (see next)
- current implementation addresses a core subset of all options, and evaluates some still moving targets
 - variants_interpretations
 - variant instances versus prototypes

Base /biosamples

/biosamples/ + query

- /biosamples/?filters=cellosaurus:CVCL_0004
 - this example retrieves all biosamples having an annotation for the Cellosaurus CVCL_0004 identifier (K562)

/biosamples/{id}/

- /biosamples/pgxbs-kftva5c9/
 - retrieval of a single biosample

/biosamples/{id}/variants/ & /biosamples/{id}/variants_in_sample/

- /biosamples/pgxbs-kftva5c9/variants/
- /biosamples/pgxbs-kftva5c9/variants_in_sample/
 - retrieval of all variants from a single biosample
 - currently and especially since for a mostly CNV containing resource variants means "variant instances" (or as in the early v2 draft variantsInSample)

Base /variants

There is currently (April 2021) still some discussion about the implementation and naming of the different types of genomic variant endpoints. Since the Progenetix collections follow a "variant observations" principle all variant requests are directed against the local variants collection.

If using g_variants or variants_in_sample, those will be treated as aliases.

/variants/ + query

• /variants/?

assemblyId=GRCh38&referenceName=17&variantType=DEL&filterLogic=AND&start=7500000&start=7676592&end=7669607&end=7800000

• This is an example for a Beacon "Bracket Query" which will return focal deletions in the TP53 locus (by position).

/variants/{id}/ or /variants_in_sample/{id} or /g_variants/{id}/

- /variants/5f5a35586b8c1d6d377b77f6/
- /variants_in_sample/5f5a35586b8c1d6d377b77f6/

/variants/{id}/biosamples/ & variants_in_sample/{id}/biosamples/

- /variants/5f5a35586b8c1d6d377b77f6/biosamples/
- /variants_in_sample/5f5a35586b8c1d6d377b77f6/biosamples/

pgxRpi

An interface API for analyzing Progenetix CNV data in R using the Beacon+ API

GitHub: https://github.com/progenetix/pgxRp

README.md

pgxRpi

Welcome to our R wrapper package for Progenetix REST API that leverages the capabilities of Beacon v2 specification. Please note that a stable internet connection is required for the query functionality. This pa aimed to simplify the process of accessing oncogenomic data from Progenetix database.

You can install this package from GitHub using:

```
install.packages("devtools")
devtools::install_github("progenetix/pgxRpi")
```

For accessing metadata of biosamples/individuals, or learning more about filters, get started from the vig Introduction_1_loadmetadata.

For accessing CNV variant data, get started from this vignette Introduction_2_loadvariants.

For accessing CNV frequency data, get started from this vignette Introduction_3_loadfrequency.

For processing local pgxseg files, get started from this vignette Introduction_4_process_pgxseg.

If you encounter problems, try to reinstall the latest version. If reinstallation doesn't help, please contact us.

	R wrapper for Progenetix			
D	Bioconductor version: Development (3.19)			
gnette	The package is an R wrapper for Progenetix REST API built upon the Beacon v2 protocol. Its purpose is provide a seamless way for retrieving genomic data from Progenetix database—an open resource dedicated to curated oncogenomic profiles. Empowered by this package, users can effortlessly access visualize data from Progenetix.

2 Retrieve meatdata of samples

2.1 Relevant parameters

type, filters, filterLogic, individual_id, biosample_id, codematches, limit, skip

2.2 Search by filters

Filters are a significant enhancement to the Beacon query API, providing a mechanism for specifying rules to select records based on their field values. To learn more about how to utilize filters in Progenetix, please refer to the documentation.

The pgxFilter function helps access available filters used in Progenetix. Here is the example use:

```
# access all filters
all_filters <- pgxFilter()
# get all prefix
all_prefix <- pgxFilter(return_all_prefix = TRUE)
# access specific filters based on prefix
ncit_filters <- pgxFilter(prefix="NCIT")
head(ncit_filters)
#> [1] "NCIT:C28076" "NCIT:C18000" "NCIT:C14158" "NCIT:C14161" "NCIT:C28077"
#> [6] "NCIT:C28078"
```

The following query is designed to retrieve metadata in Progenetix related to all samples of lung adenocarcinoma, utilizing a specific type of filter based on an NCIt code as an ontology identifier.

```
biosamples <- pgxLoader(type="biosample", filters = "NCIT:C3512")</pre>
# data looks like this
biosamples[c(1700:1705),]
          biosample_id group_id group_label individual_id callset_ids
#>

Components of an Online Bioinformatics Resource Going Full Stack?

Components of an Online Bioinformatics Resource A Stack to work with/through

- dedicated server or cloud storage
- own domain institutional sub-domain or fixed address cloud service sub-domain
 - progenetix.org | mls.uzh.ch/en/research/baudis | baudisgroup.github.io
- database or flat file data management
 - SQL databases such as PostGres, MySQL
 - ➡ document databases such as MongoDB, CouchDB …
 - ➡ hierarchical file system & index files
- webserver gateway for server-side generated, active content delivery

➡ Perl CGI, Python, PHP ...

active front-end (JavaScript environment)?

- no separate *runs* collection; integrated w/ analyses
- *variants* are stored per observation instance

analyses

biosamples

Entity collections

 JavaScript front-end is populated for query results using asynchronous access to multiple handover objects

- biosamples and variants tables, CNV histogram, UCSC .bed loader, .pgxseg variant downloads...
- the complete middleware / CGI stack is provided through the *bycon* package
 - schemas, query stack, data transformation Phenopackets generation)...

Progenetix Stack

- *collations* contain pre-computed data (e.g. CNV frequencies, statistics) and information for all grouping entity instances and correspond to filter values
 - PMID:10027410, NCIT:C3222, pgx:cohort-TCGA, pgx:icdom-94703...
- *querybuffer* stores id values of all entities matched by a query and provides the corresponding access handle for handover generation

collations

geolocs

Utility collections

genespans publications

Last but NOT Least... **Documentation is, actually, rather important**

Documentation Strategies (Not so) Best Practices

- What is documentation? I'll remember this
- Just email me if help is needed, unexpectedly
- We had money for a chat bot.
- Clean code documents itself Just use explicit variable/function names.
- Clean code documents itself Never use explicit variable/function names.
- Perl POD it is. There is a command to show the notes in your terminal...
- I wrote a paper about the resource. In 2001.
- Haven't you found the GoogleGroups account?
- Documentation? StackOverflow, whelp!

 $f_d = f_d_s[c_t]$ $r = \{\}$ for k in res_schema.keys(): if k in f d: r.update({k:f_d[k]})

mbaudis@netscape.net

normalize_variant_values_for_export(v, byc, drop_fields=None):

DRMATICS APPLICATIONS NOTE

Technical documentation lives here

Read the Docs simplifies software documentation by automating building, versioning, and hosting of your docs for you.

Free docs hosting for open source

We will host your documentation for free, forever. There are no tricks. We help over 100,000 open source projects share their docs, including a custom domain and theme.

Always up to date

Whenever you push code to your favorite version control service, whether that is GitHub, BitBucket, or GitLab, we will automatically build your docs so your code and documentation are never out of sync.

Downloadable formats

We build and host your docs for the web, but they are also viewable as PDFs, as single page HTML, and for eReaders. No additional configuration is required.

Multiple versions

We can host and build multiple versions of your docs so having a 1.0 version of your docs and a 2.0 version of your docs is as easy as having a separate branch or tag in your version control system.

GA4GH Variation Representation Specification

The Variation Representation Specification (VRS, pronounced "verse") is a standard developed by the Global Alliance for Genomic Health to facilitate and improve sharing of genetic information. The Specification consists of a JSON Schema for representing many classes of genetic variation, conventions to maximize the utility of the schema, and a Python implementation that promotes adoption of the standard.

Standards

The Progenetix resource utilizes standardized diagnostic coding systems, with a move towards hierarchical ontologies. As part of the coding process we have developed and provide several code mapping resources through repositories, the Progenetix website and APIs.

Additionally to diagnostic and other clinical concepts, Progenetix increasingly uses hierarchical terms and concepts for the annotation and querying of technical parameters such as platform technologies. Overall, the Progenetix resource uses a query syntax based around the Beacon v2 "filters" concept with a CURIE based syntax.

List of filters recognized by different query endpoints

Public Ontologies with CURIE-based syntax

Documentation Strategies Best Practices

- start early
- update often
- sometimes try to follow your own guide
- balance between inline documentation & doc system
- use Markdown
- plan for contingencies cloud providers disappear | cancel services | change terms

https://en.wikipedia.org/wiki/List of defunct social networking_services https://en.wikipedia.org/wiki/List of search engines#Defunct or acquired search engines

Progenetix as Example Genomics Resource Some trajectories ...

- from local database to online resource
- from flat database to hierarchical object storage
- from dedicated database to mix of open software tools
- from static pages to **data driven website**
- from copy, paste, clean to automated download & process still edit & clean
- from registered access to raw data & commercial licensing to CC BY 4.0 (CC0 for tools)
- from local software development to open code on Github
- from standalone resource to federated data, APIs and services

(Bio)informatics Skill Set What has been needed to develop & maintain progenetix.org?

- Scripting and application development using Python, Perl and JavaScript
- Data analysis and plotting in R, Python and Perl
- Regular expressions for data entry an (programmatic) identifier matching
- JSON, YAML, tab-delimited text as file formats; some binary source files (.CEL)
- non-SQL database (MongoDB) for flexibility and document structure
- web development with Perl, Python, JS, React and Apache server; Cloudflare
- No proprietary software involved (some OpenOffice Calc / Google Sheets spreadsheets for data cleanup)

(Bio)informatics Skill Set

What has been needed to develop & maintain progenetix.org?
